- Lessons

Retroviruses

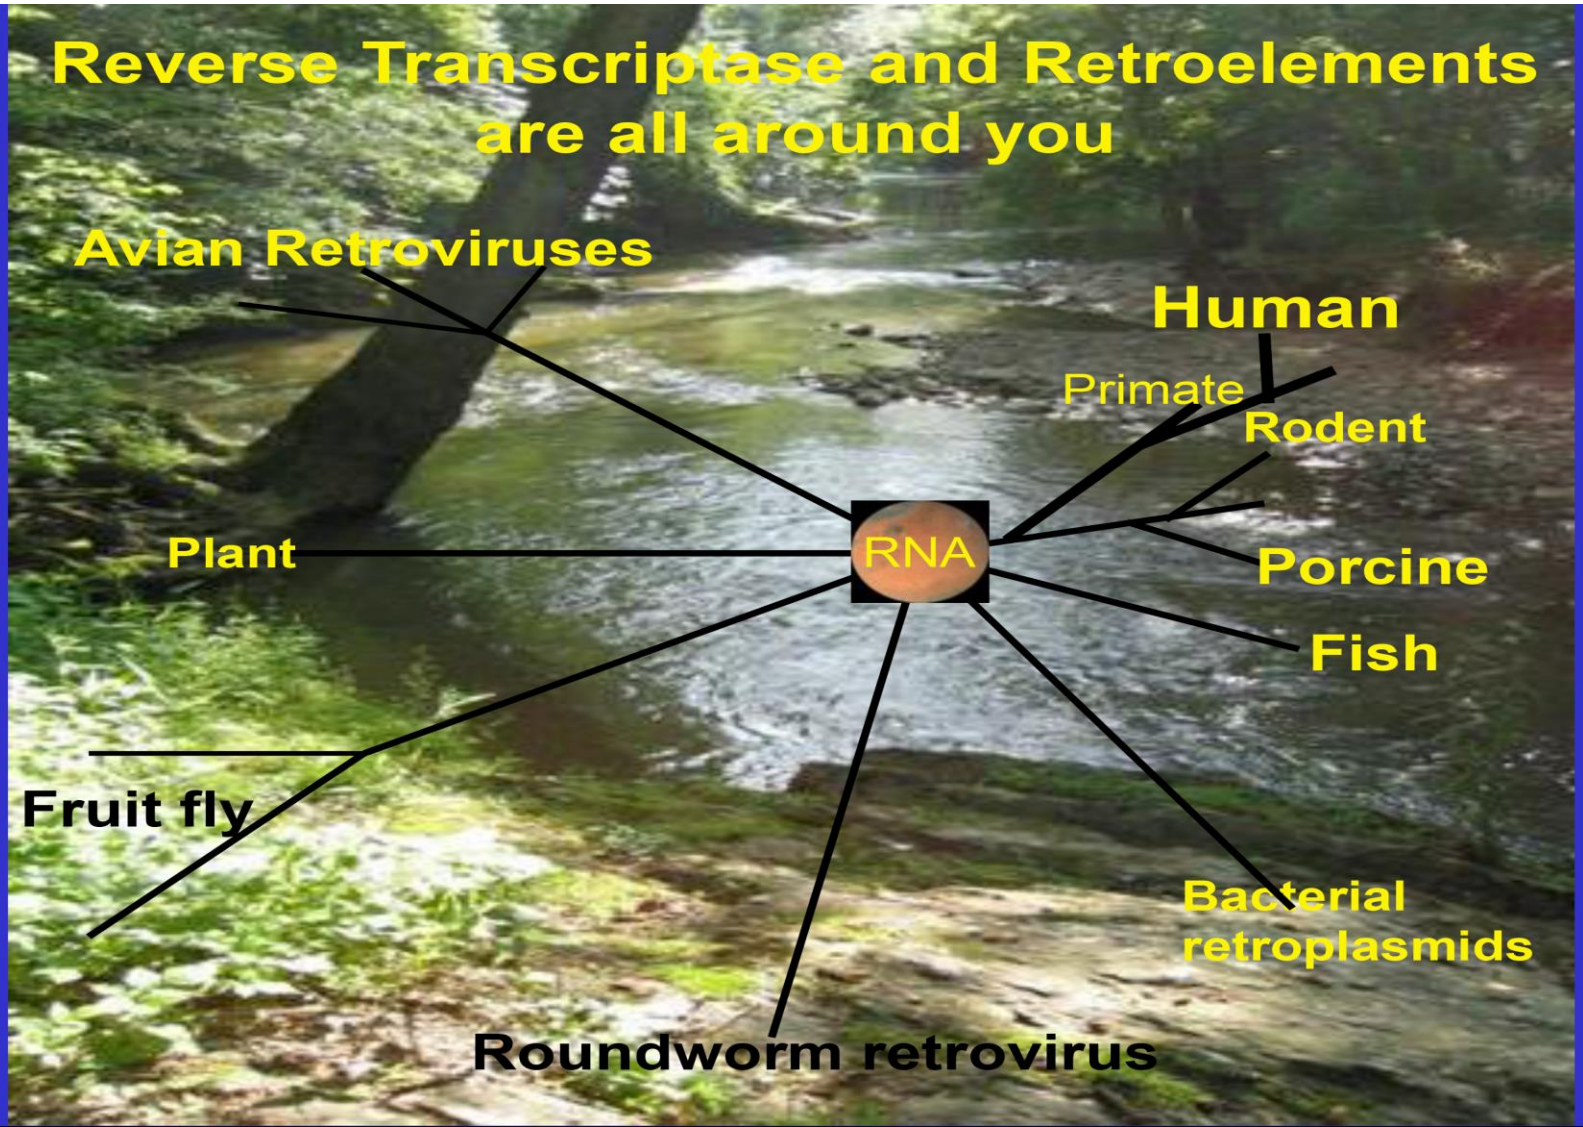
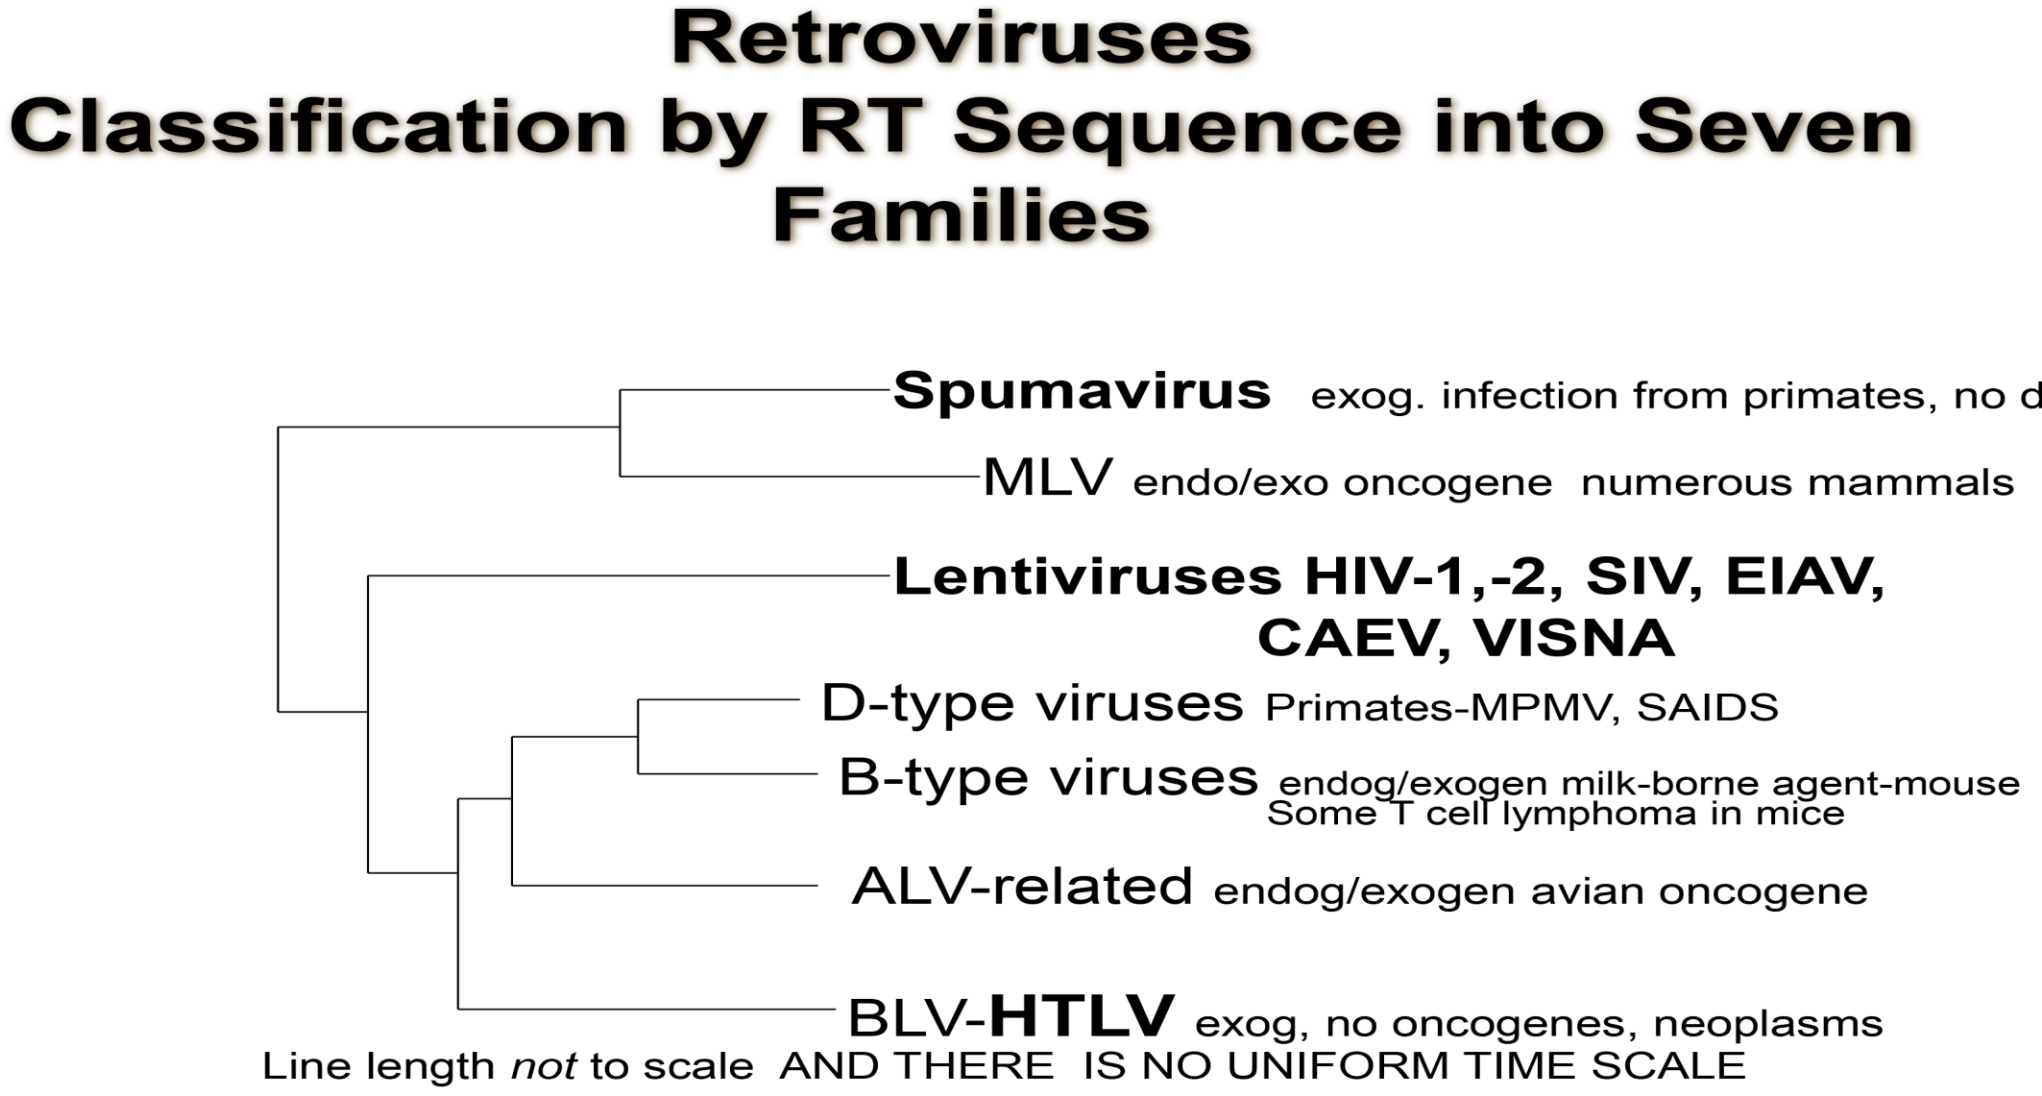
A group of RNA viruses that replicate via a DNA intermediate using Reverse Transcriptase.

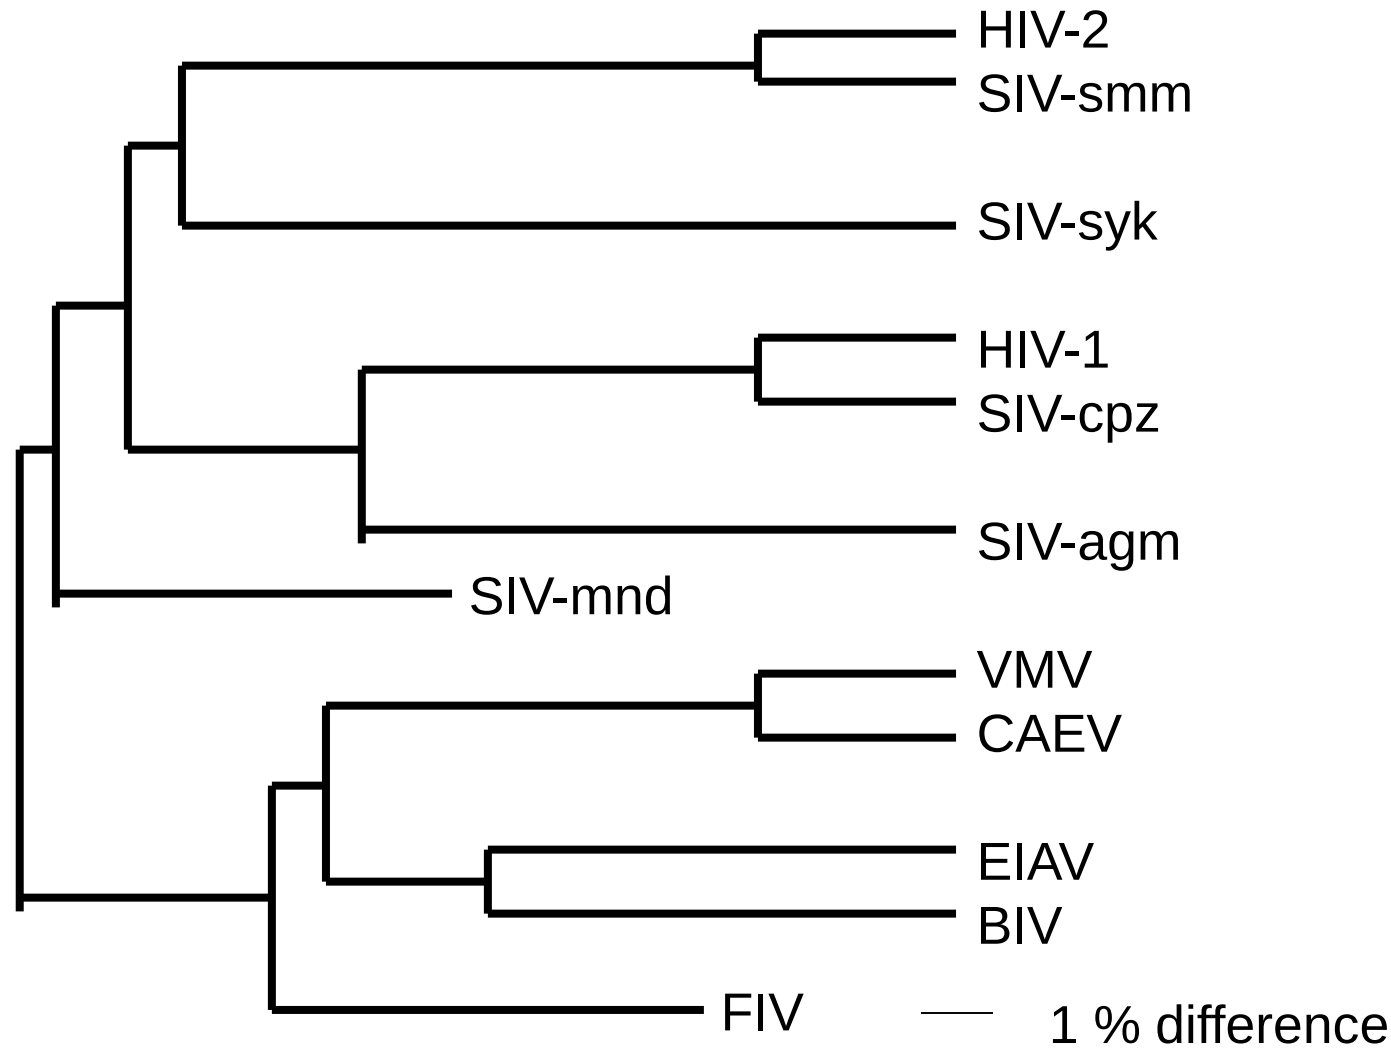
Retroelements



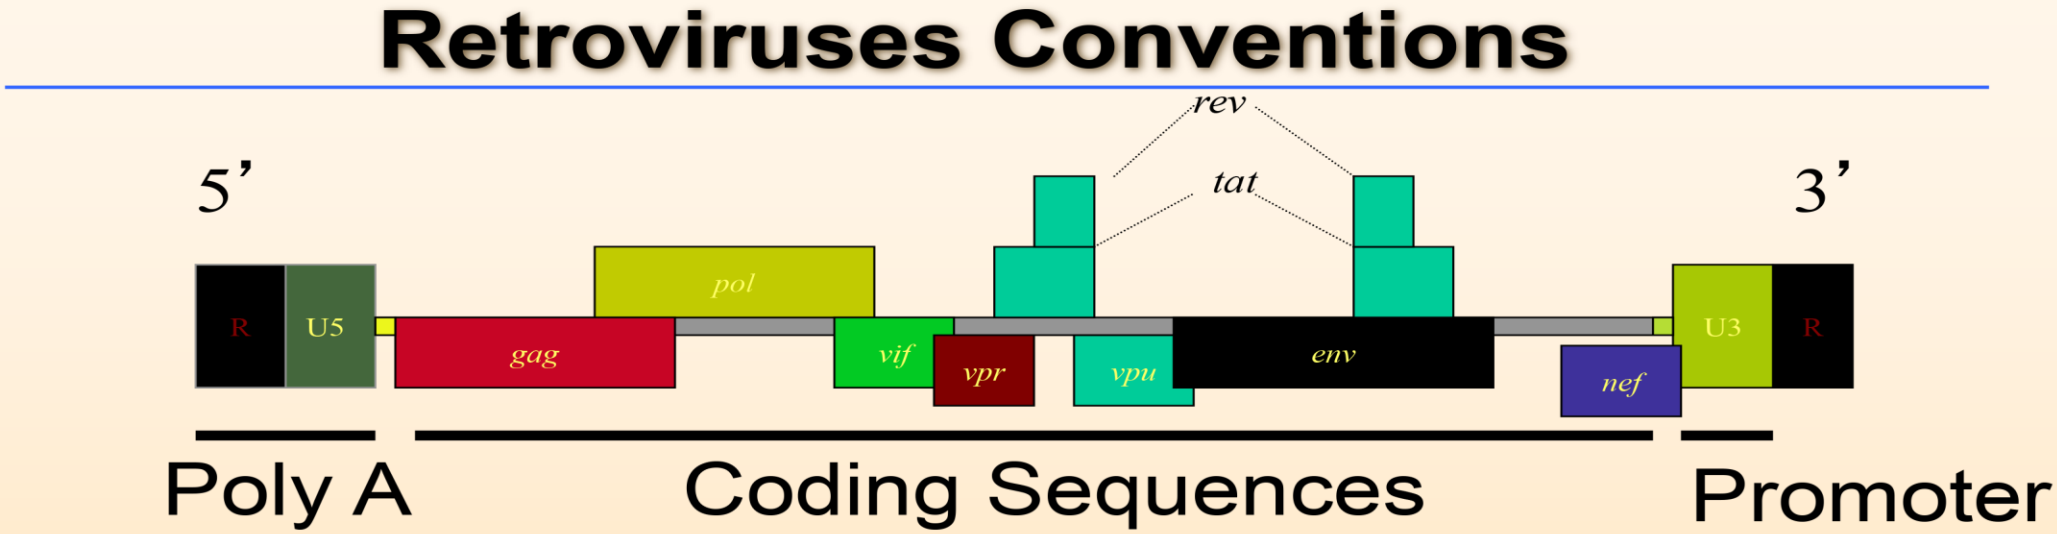
Retrovirus classification



Lentivirus Relationships



Retrovirus conventions

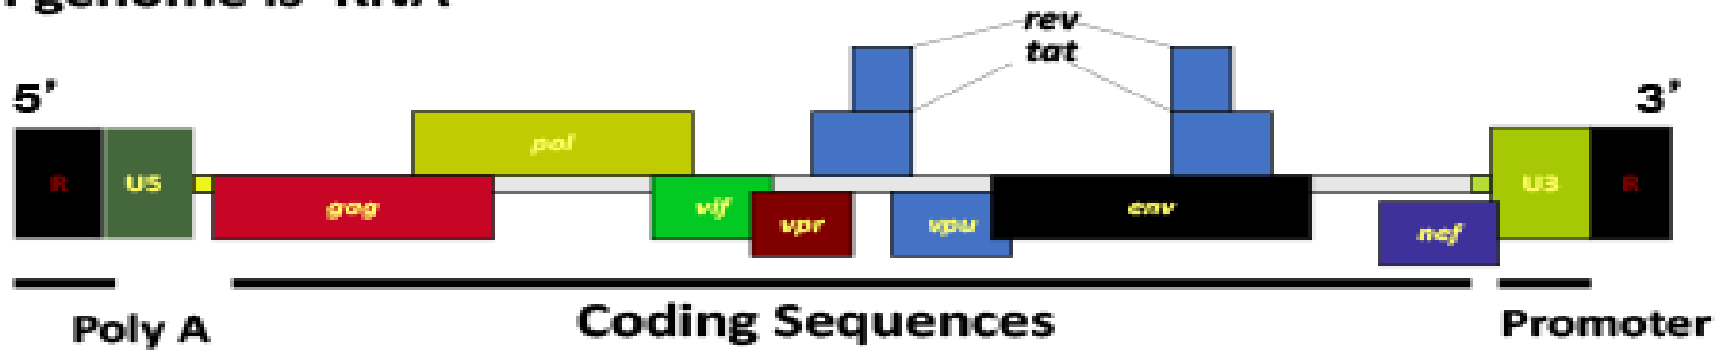


Names of genes in lower case *italics*, e.g., *pol, env*
Protein gene products are capitalized, e.g., Reverse Transcriptase, Gp120

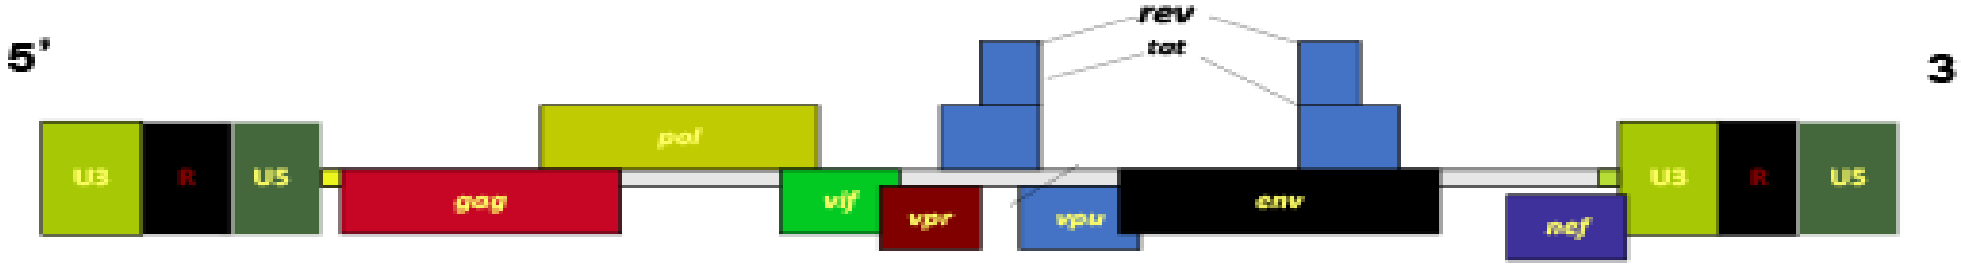
Retrovirus conventions

Retroviruses Conventions

The viral genome is RNA



The integrated genome is called the provirus



Names of genes in lower case *italics*, e.g., *pol, env*

Protein gene products are capitalized, e.g., Reverse Transcriptase, Gp120

Retroviruses Glossary

- *gag: group antigen*
- *pol: polymerase*
- *env: envelope*
- *tat: Transactivator*
- *rev:Regulator of Expression of Virion proteins*

- U3: unique sequence in 3' region
- U5: Unique sequence in 5' region
- R: Repeat sequence
- PBS Primer binding site for initiation of RT
- Ppt: polypurine tract primer for RT
- TAR: Tat activating sequence
- RRE: Rev responsive element
- Provirus: copy of retrovirus that is integrated into host genome

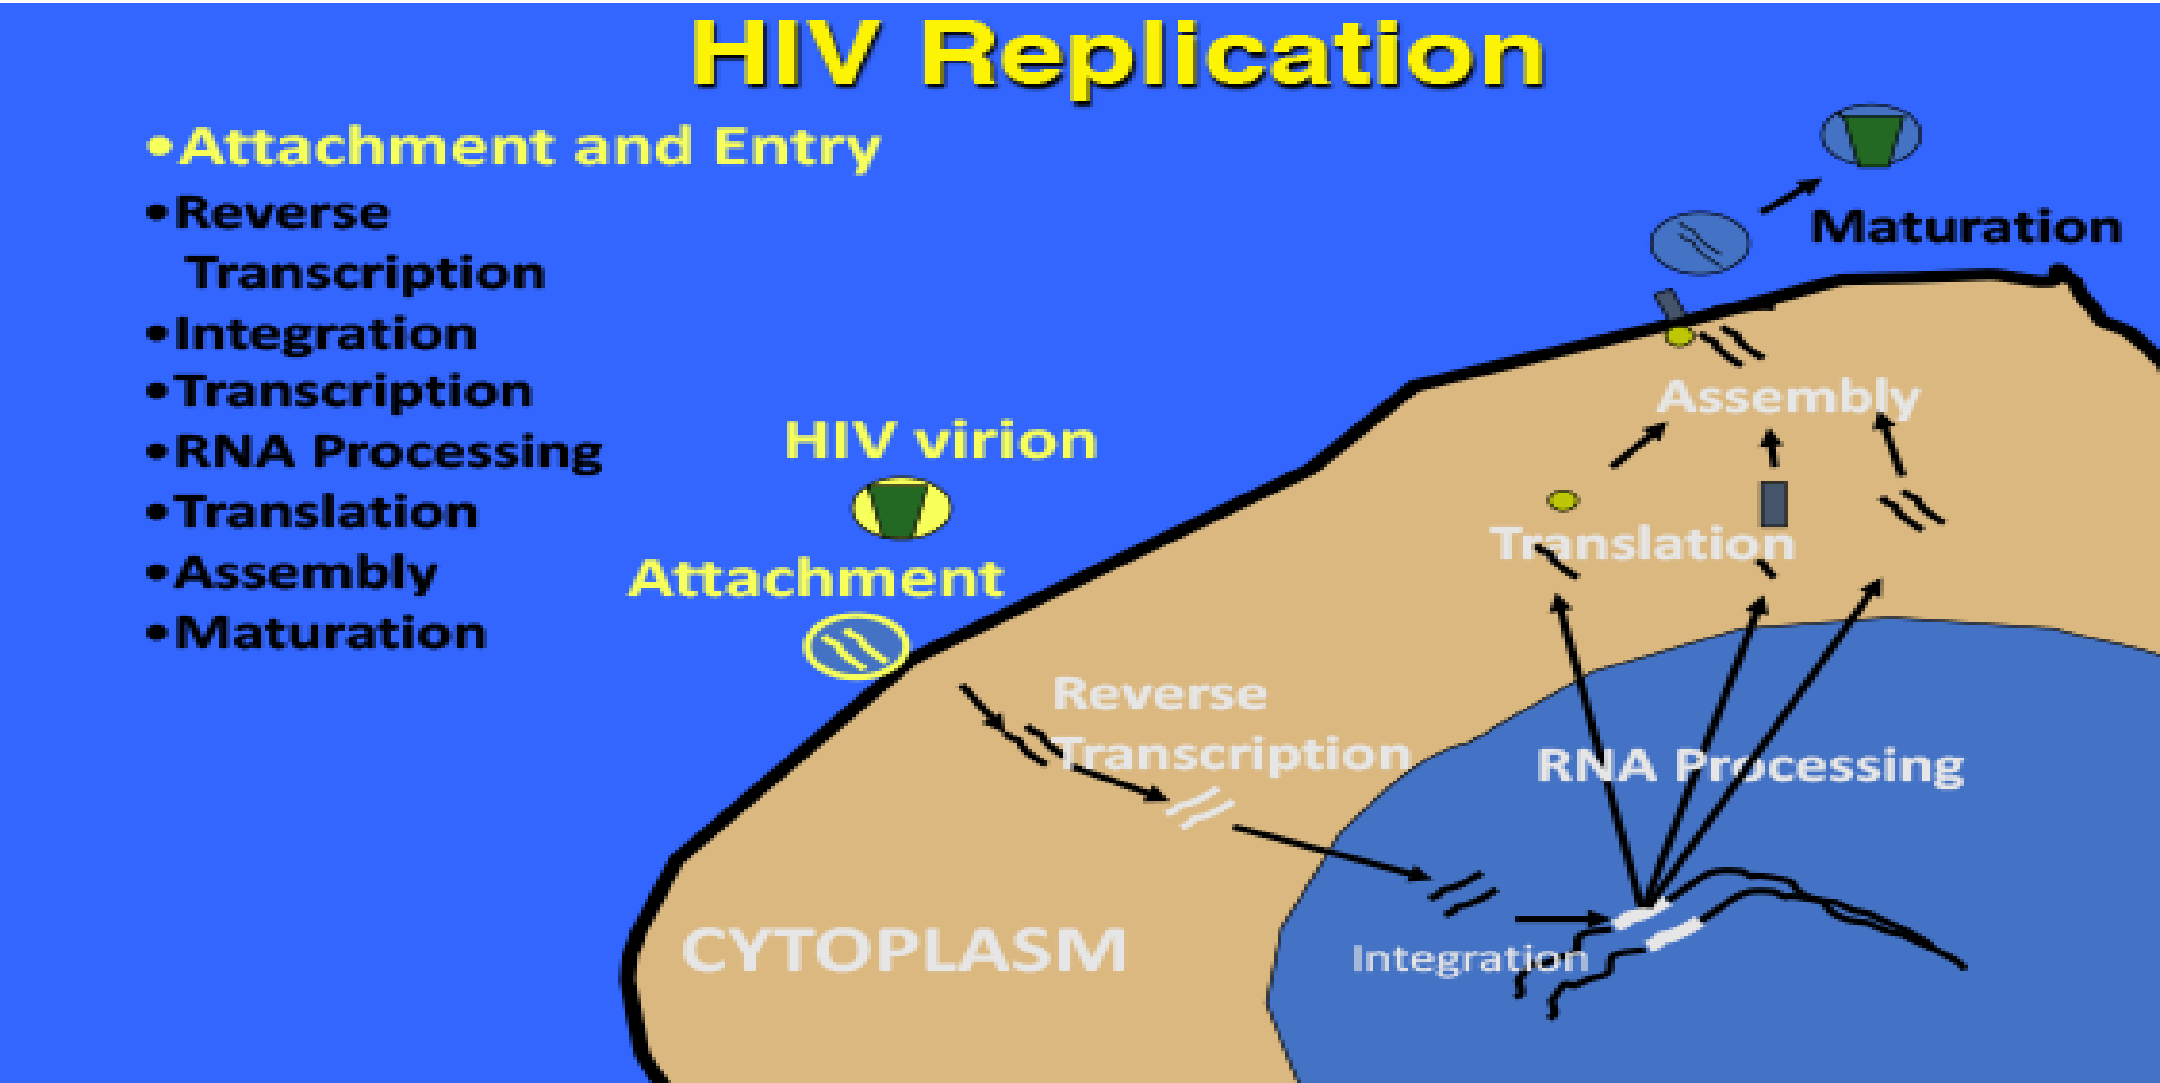
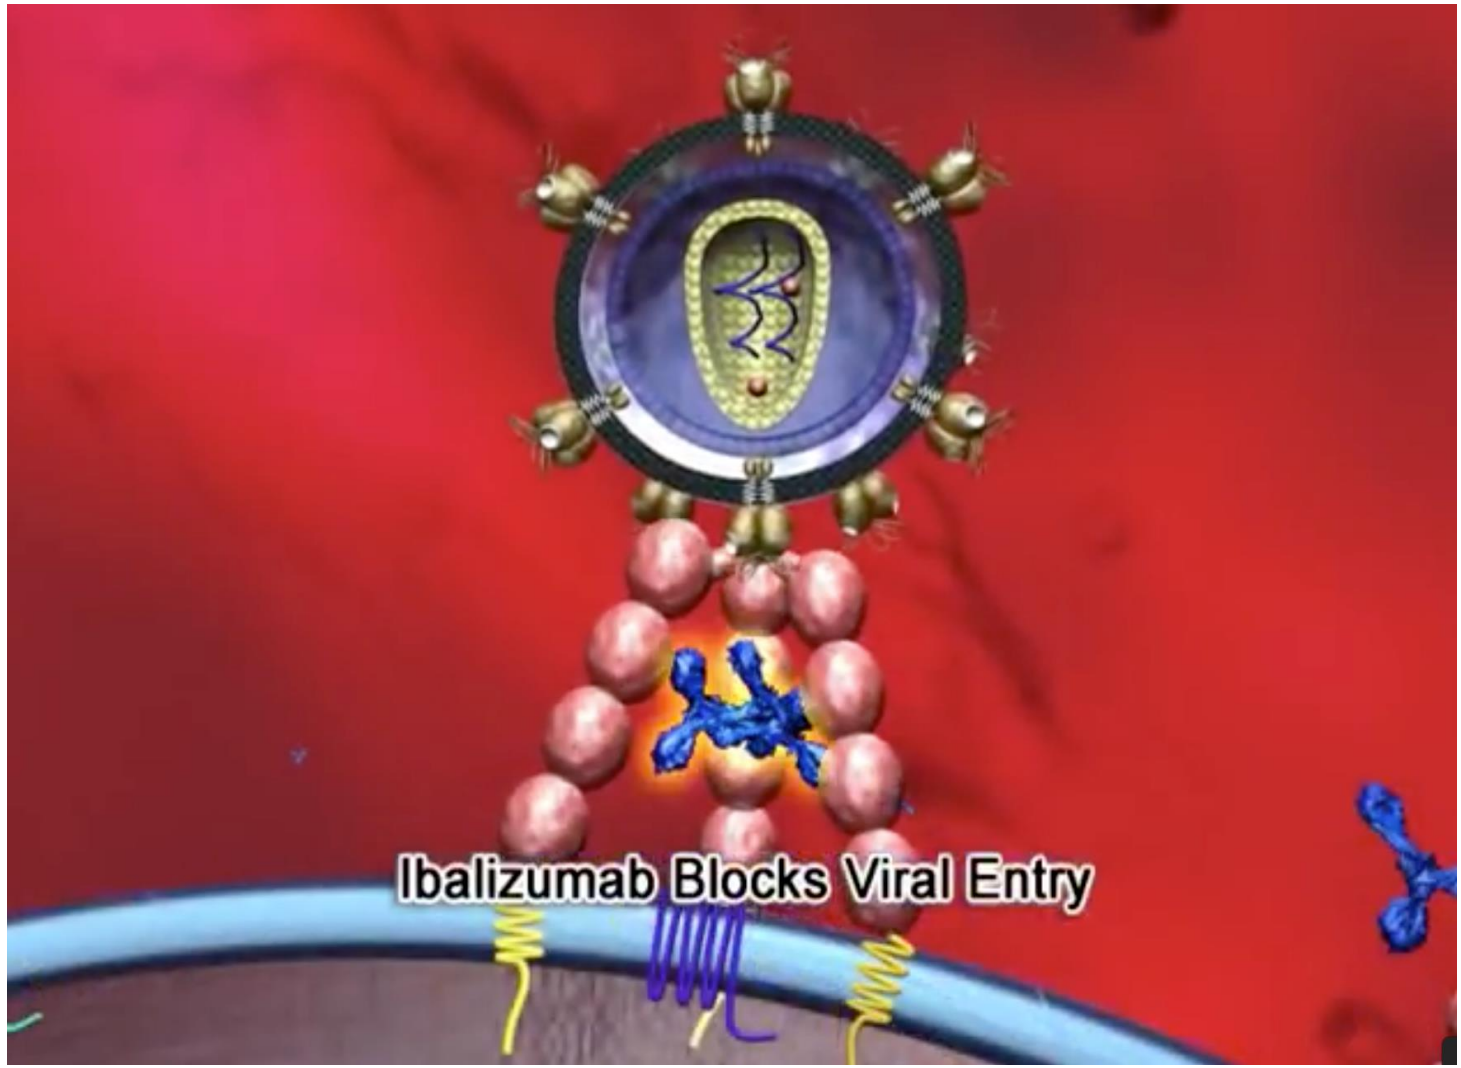
HIV replication



HIV Attachment and Entry

- **Virus Factors**
  - **Attachment: Env glycoprotein gp120**
  - **Entry: Env glycoprotein gp41**
- **Host Cell Factors**
  - **Receptor**
    - **CD4**
  - **Co-receptor (major)**
    - **CXCR4**
    - **CCR5**

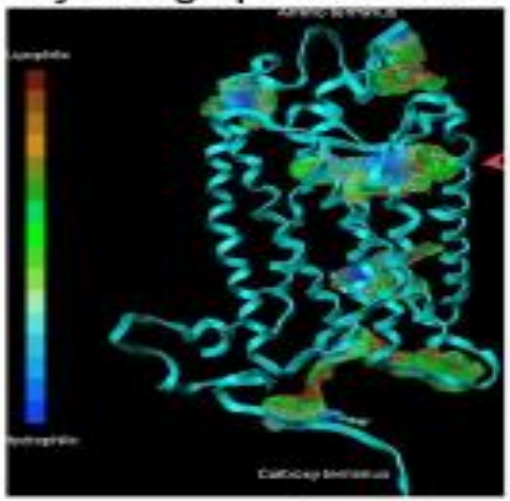
Blocking the HIV Receptor: Ibalizumab

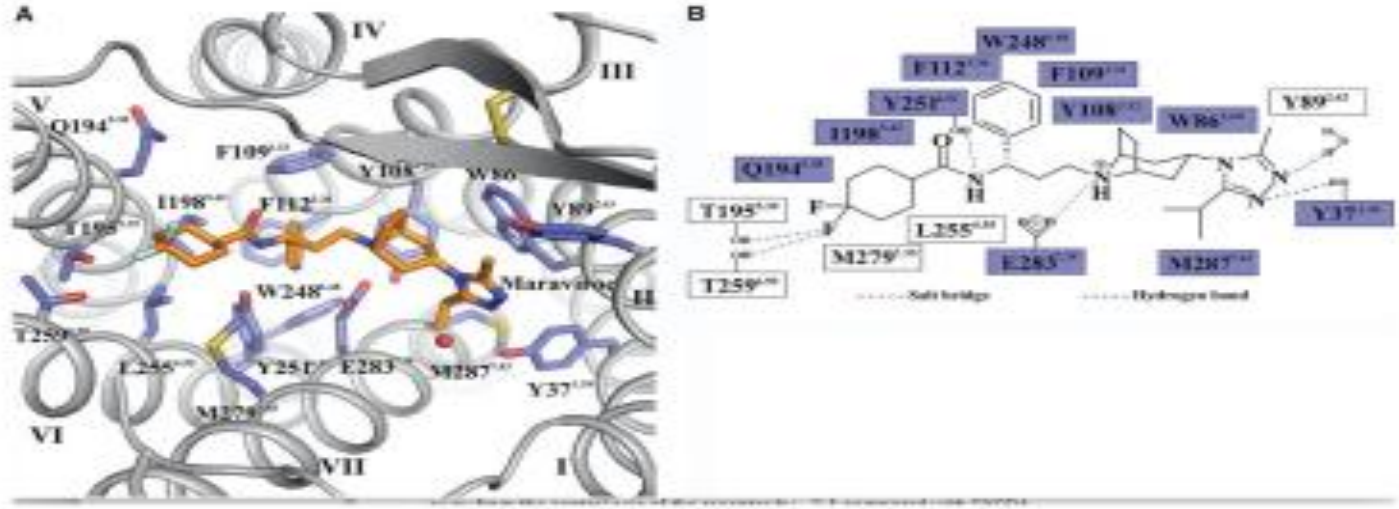


Blocking the HIV coreceptor

Blaocing the HIV Coreceptor: Maraviroc

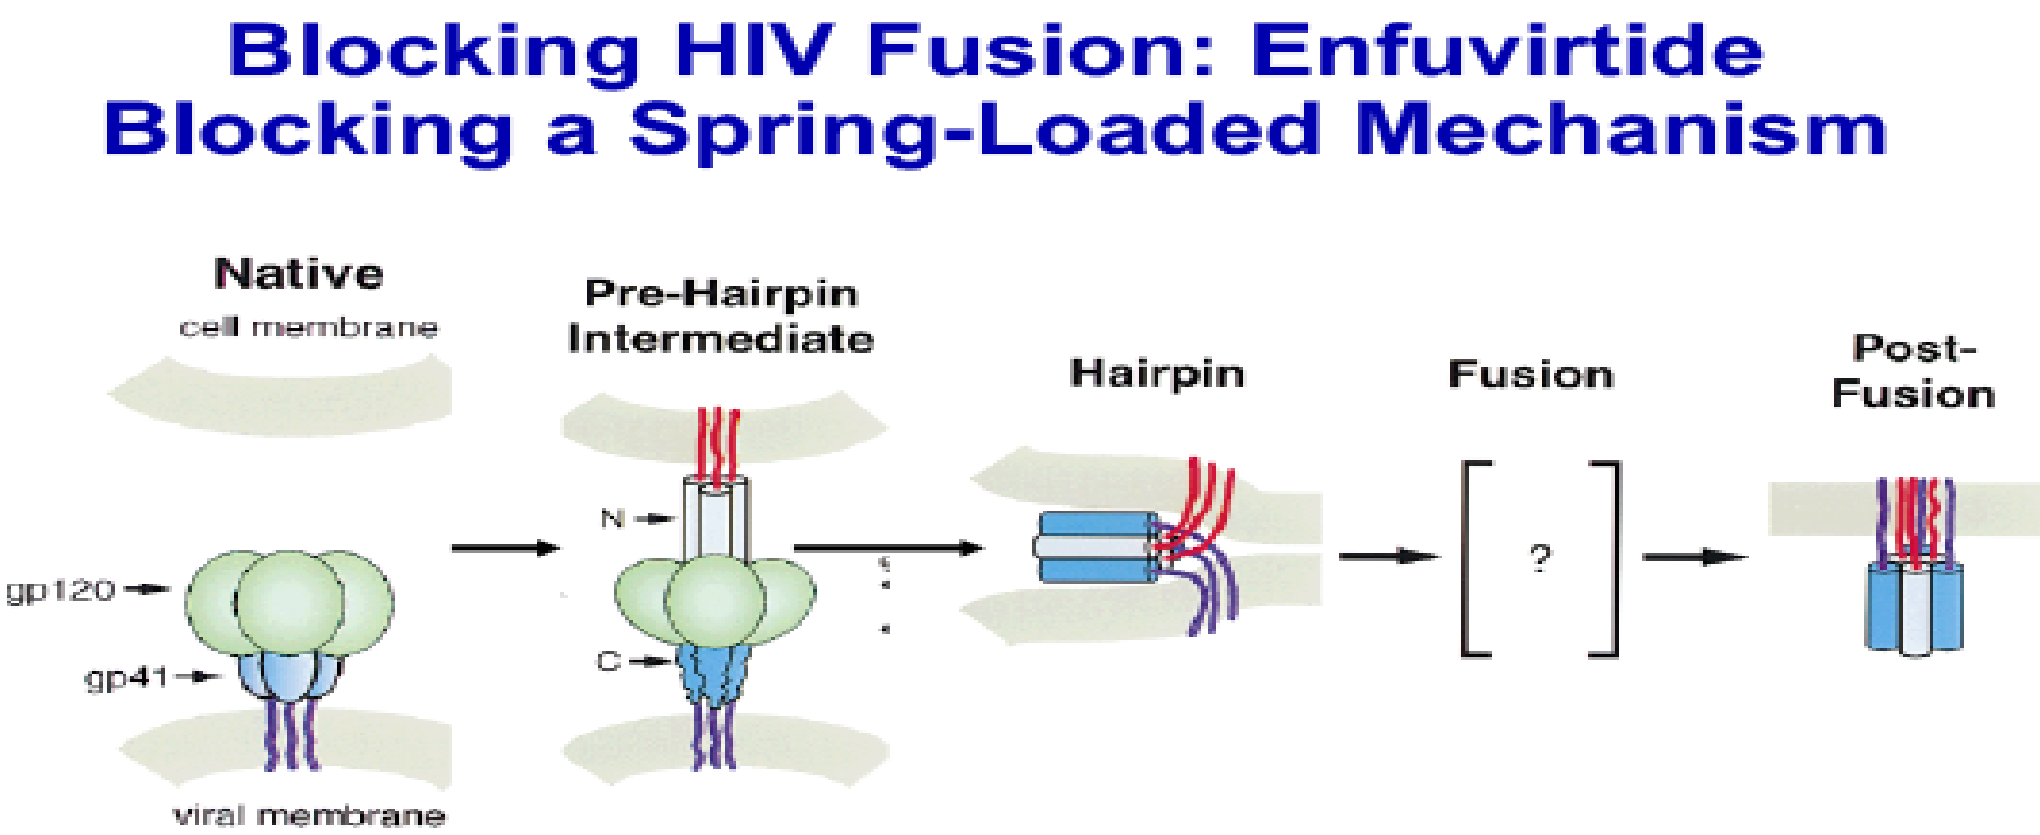
Crystallographic Structure



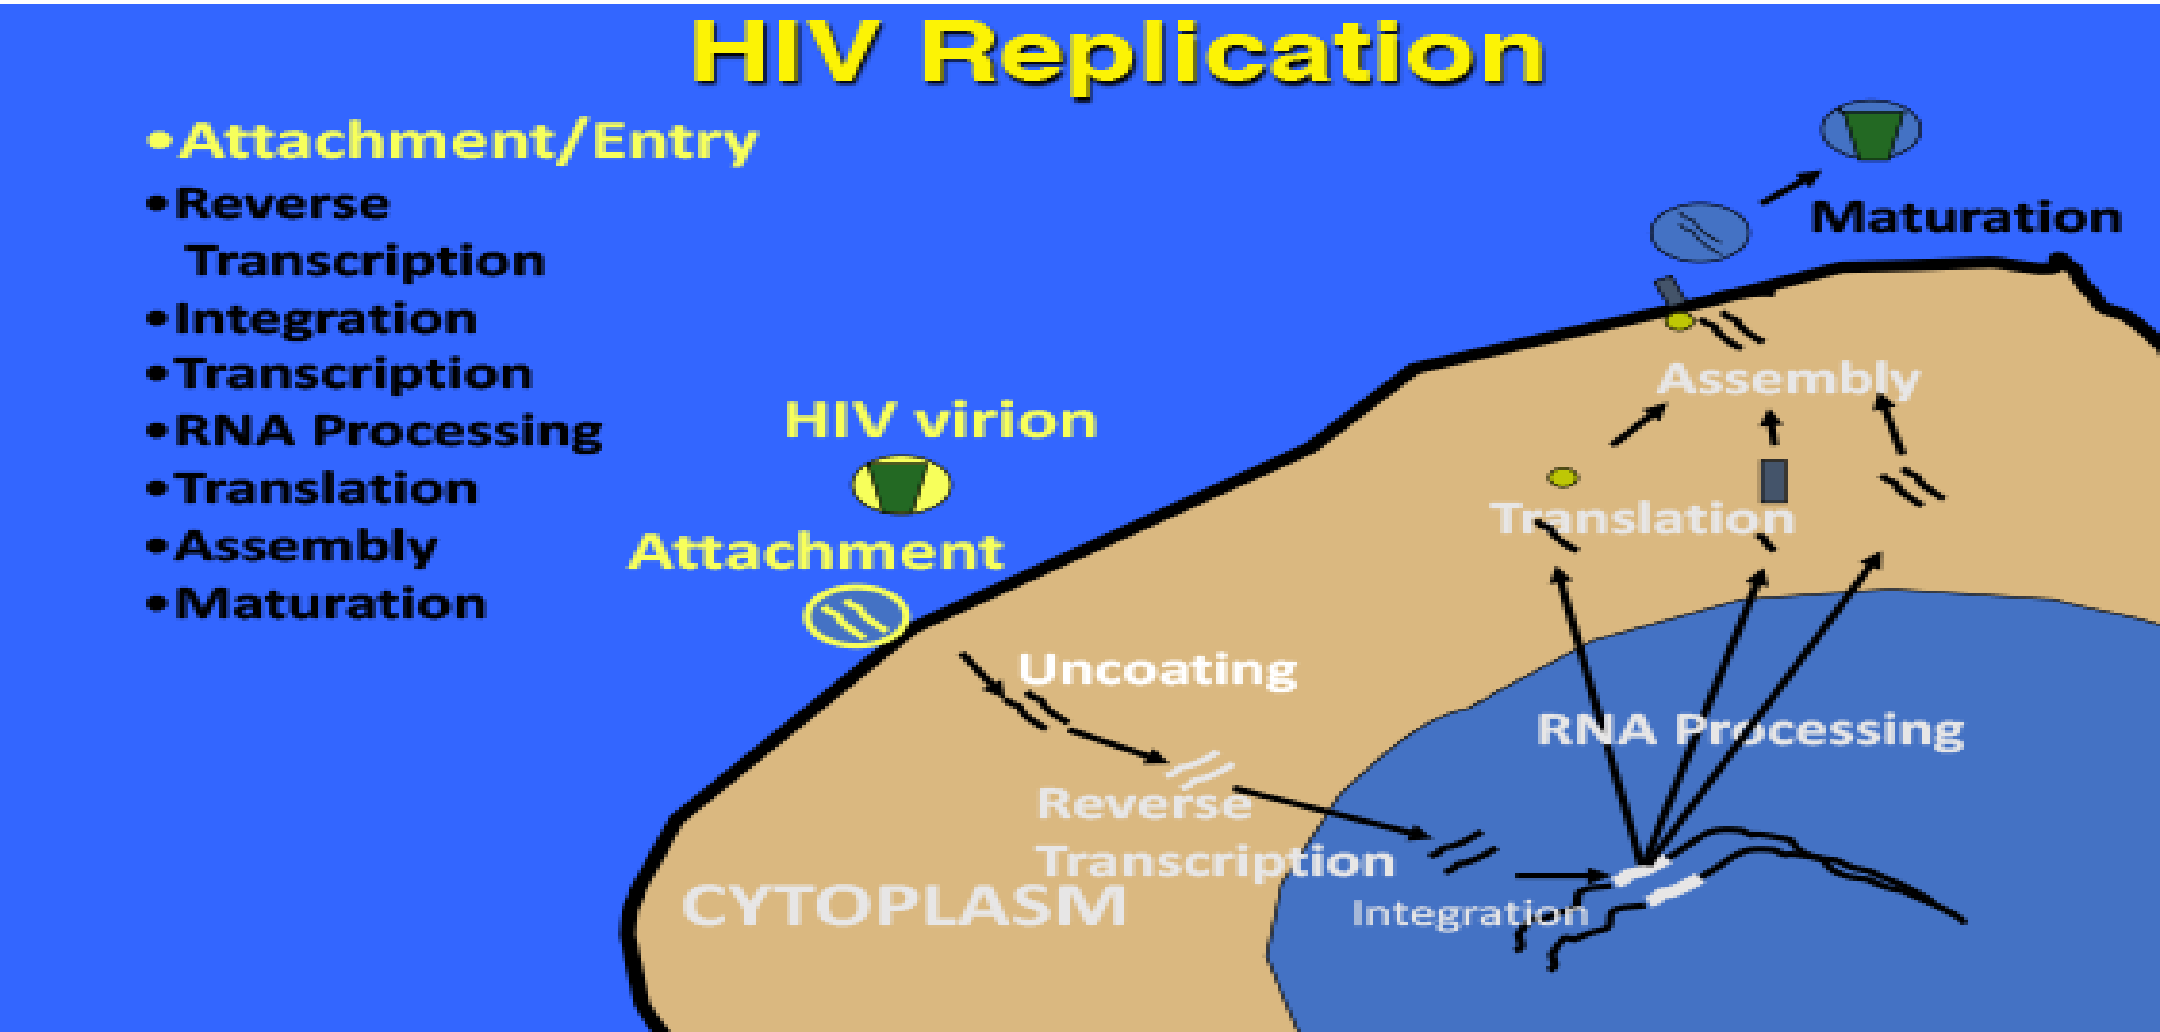


-Multiple binding domains predicted
  -Binding disrupts structure generally
  -Does not require blocking CCR5-gp120 interaction
  -Potential for simultaneous inhibition
-Resistance emerges by reducing affinity for drug

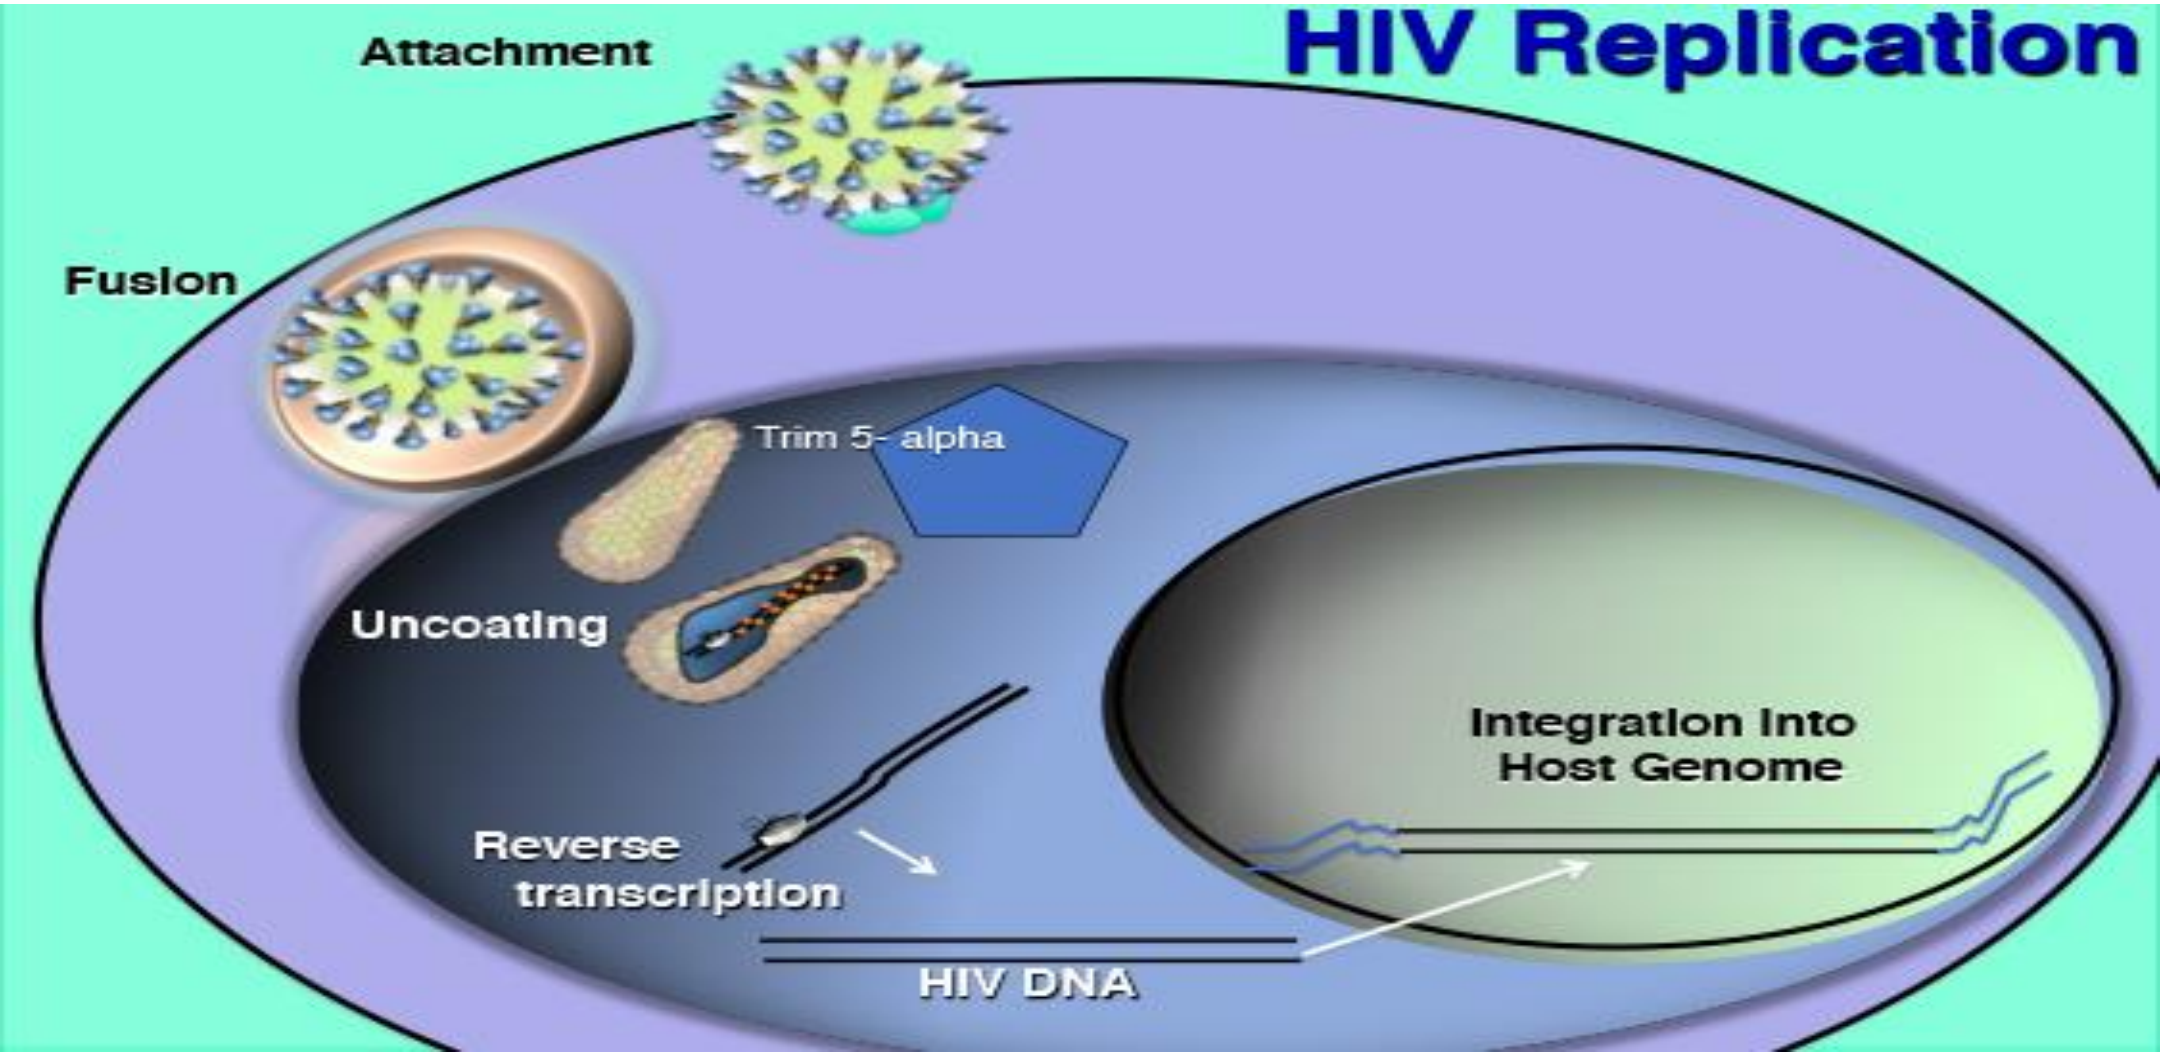
Blocking HIV Fusion



HIV replication



HIV replication



HIV Post-Entry events

HIV Post – Entry Events

- Uncoating is a fundamental step in virus replication
  - Restricts replication
  - Source of host range restriction
- Requires interactions between viral and cellular factors
- Virus
  - Gag
- Cell
  - Trim 5 – alpha

HIV Post-Entry events

HIV Post – Entry Events

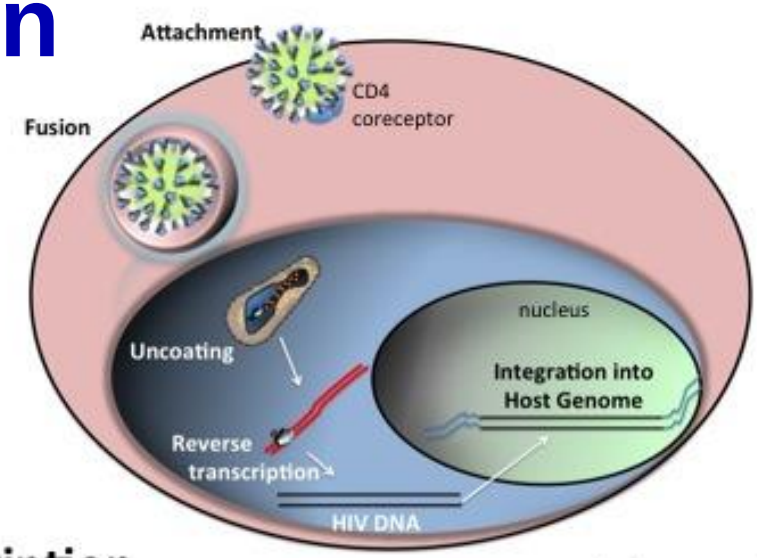
Host Trim5 Alpha

VIRUS	Human	Chimp	Monkey
HIV	Infection	Infection	NO INFECTION
SIV Chimp	INFECTION	Infection	Poor infection
SIV Monkey	INFECTION	Poor infection	Infection

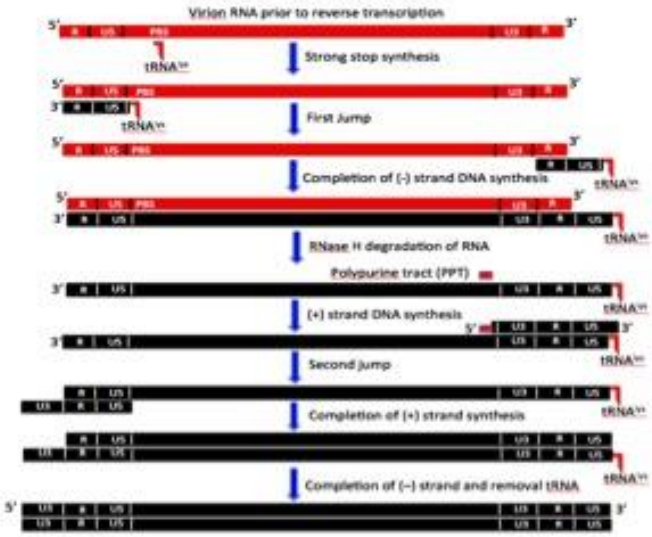
Positive Selection in Trim 5-alpha

- Trim 5 alpha undergoes genetic change faster than many genes
- Working hypothesis
  - human populations undergo waves of pandemics
  - Humans that survive have trim 5alpha variant that excludes infection

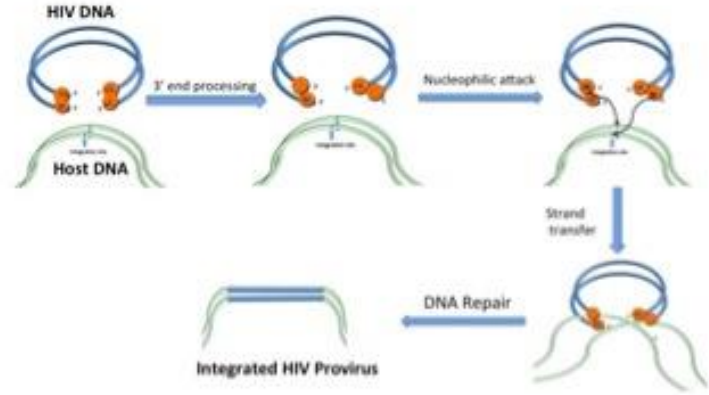
HIV Reverse Transcription and Integration



Reverse Transcription



Integration



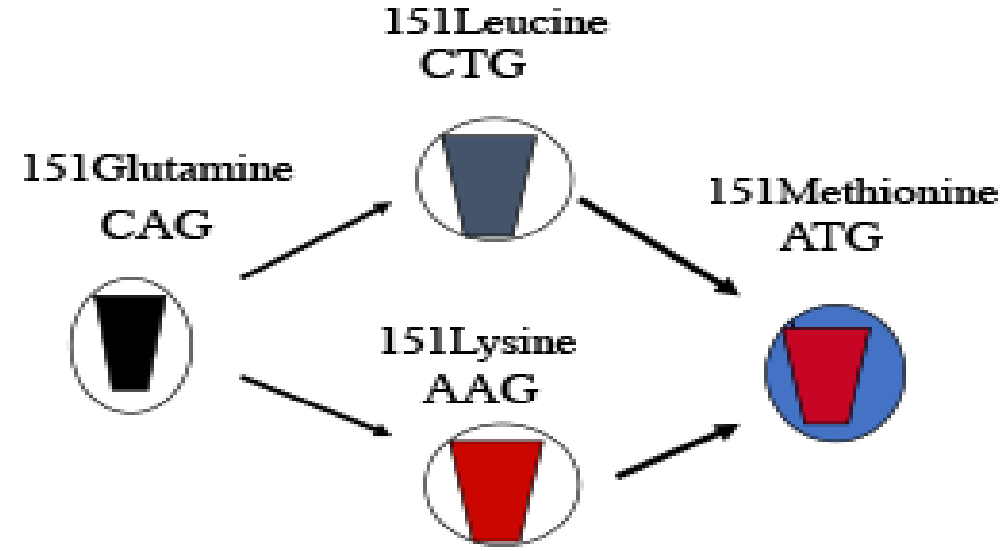
Reverse Transcriptase Enzymatic Activities

- **RNA-dependent DNA Polymerase**
- **RNase H**
- **DNA-dependent DNA Polymerase**
- **Error rate on order of 1-4 / 100,000 bases synthesized**
- **Recombination occurs during reverse transcription permitting reassortment of sequences**
- **Replication rapid and error prone**

Error-Prone HIV replication

Error-Prone HIV Replication is a Pathogenic Determinant

- Each round of HIV replication generates numerous mutants.
- The ability of the mutants to replicate (viral "fitness") may vary greatly.
- The virus population can respond rapidly to a selective pressure



HIV Reverse Transcription and Integration

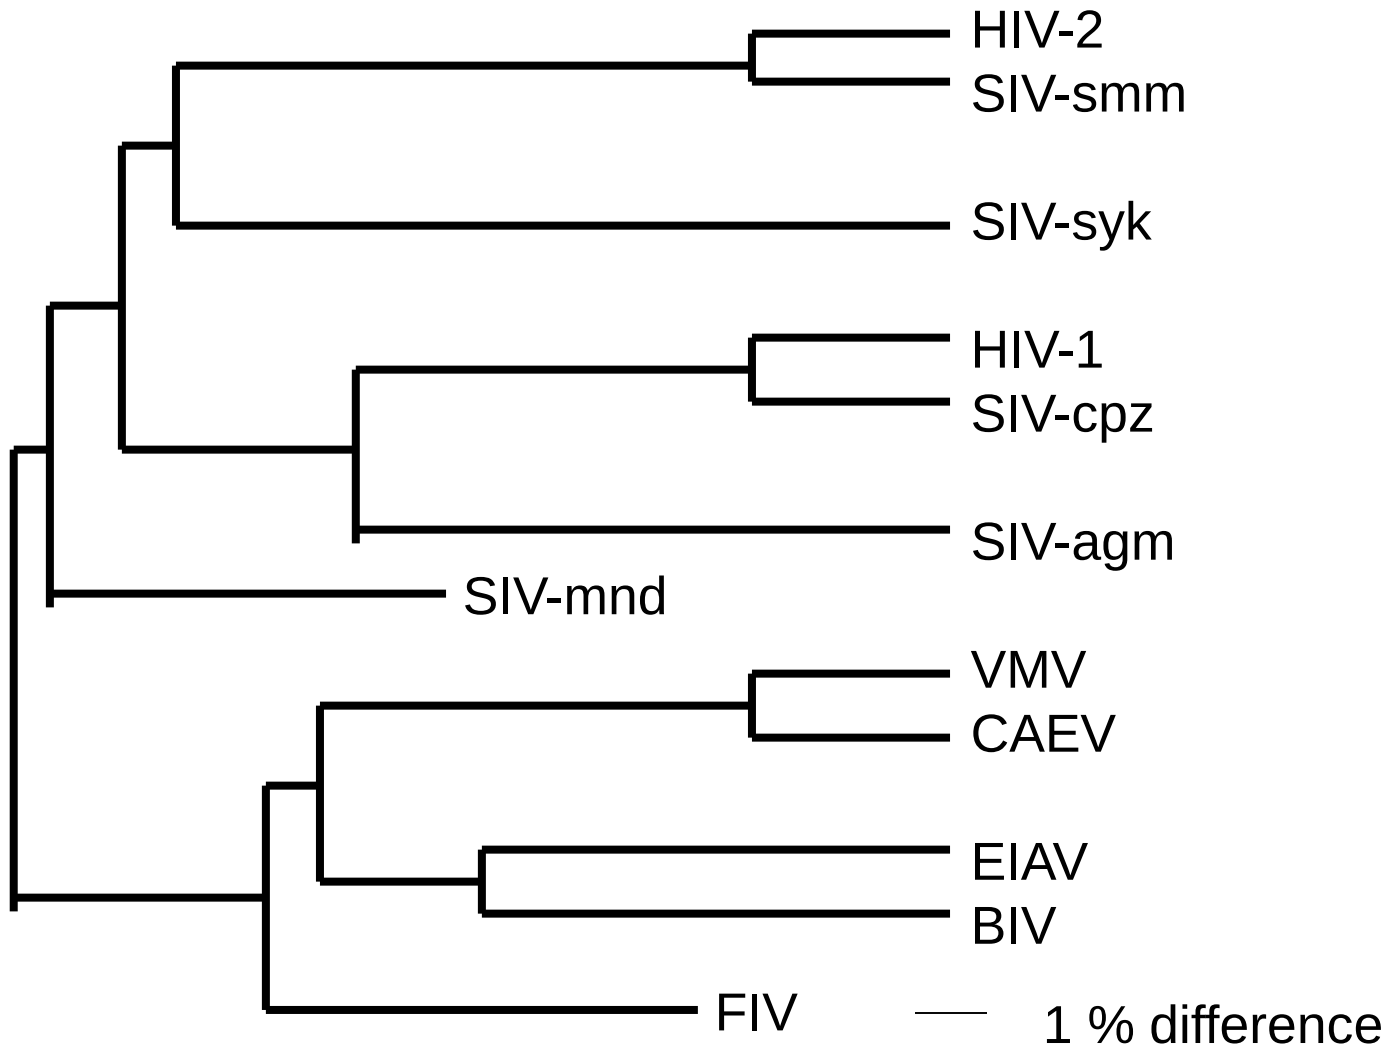
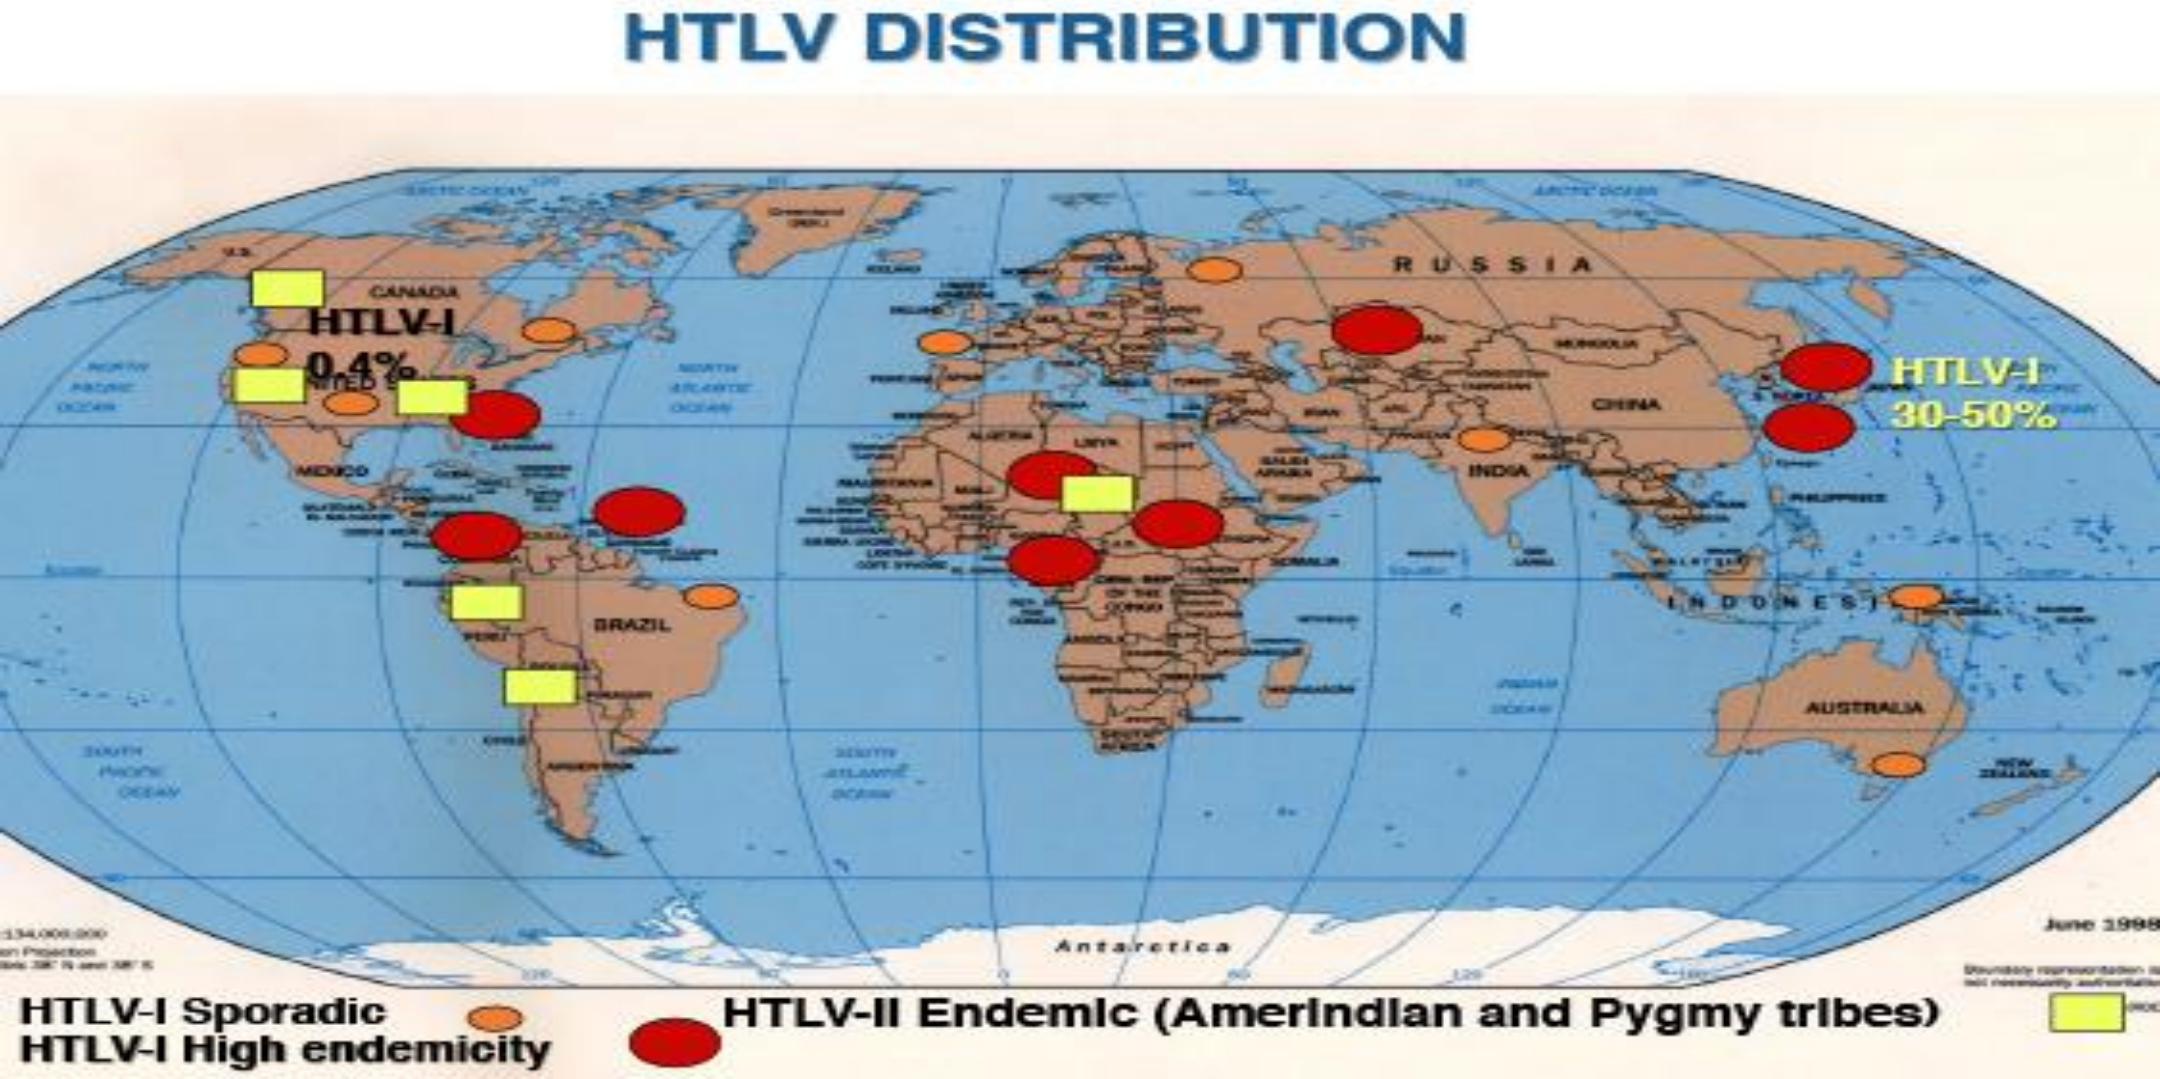
- Emergence/Spread
- Lessons

Lentivirus Relationships



HTLV distribution

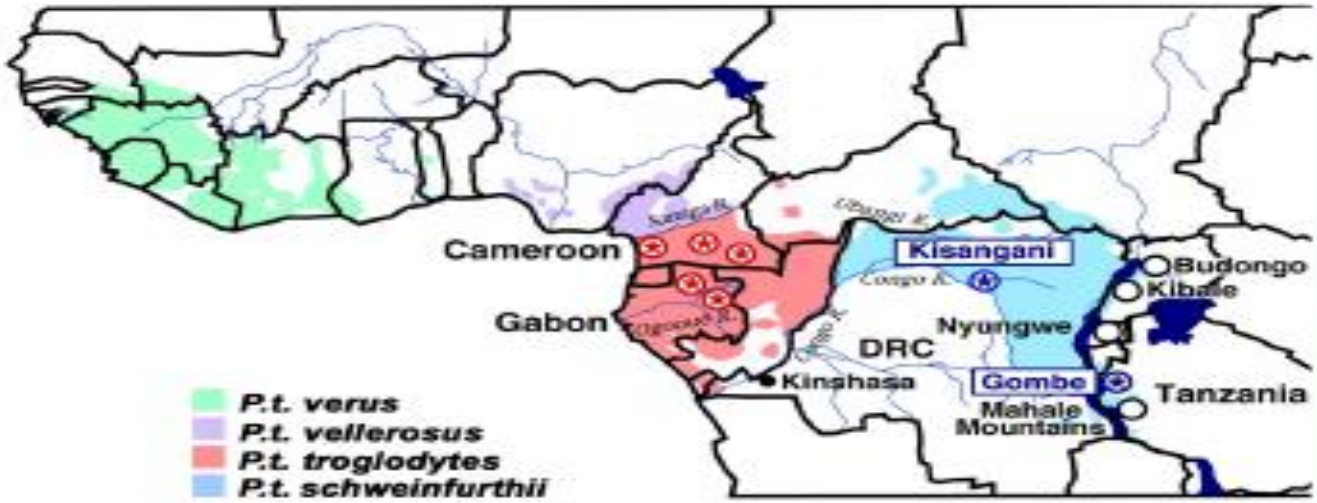


HTLV-I ATL

- Long Latency (>30 years)
  - Small pediatric series in SA
- Epidemiology
  - Approximately 1% of HTLV- I infected adults
- Associated syndromes
  - Infectious
    - TB, MAC, Leprosy
    - PCP
    - Strongyloides
    - Scabies esp. Norwegian scabies
  - Noninfectious-hypercalcemia+lytic bone lesions
- Therapy-Chemotherapy, Ifn, anti-Tac

HIV-1 origins

Higher Primate Origins of HIV-1



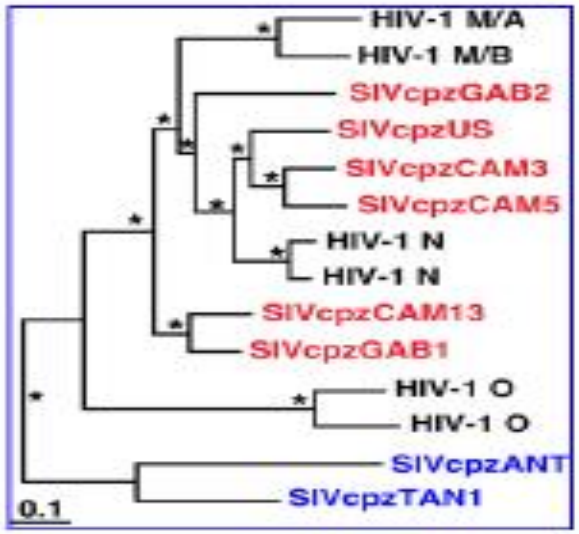


FIG. 2. Evolutionary relationships of SIVcpz and HIV-1 strains based on maximum-likelihood phylogenetic analyses of full-length envelope protein sequences (adapted from ref. 10). SIVcpz strains from *P. t. troglodytes* and *P. t. schweinfurthii* are highlighted in red and blue, respectively. Representative strains of HIV-1 groups M, N, and O were included for comparison. Asterisks indicate internal branches with estimated posterior probabilities of 95% or higher. The scale bar denotes 10% replacements per site.

Hahn and coworkers JV 2005

Bushmeat trade

Bushmeat Trade in Central and West Africa

Potential opportunities for Zoonotic Events

Phylogenetic Analyses Date Introduction to Late 1800's-Early 1900's

BUT WHY THEN?

HIV Spread

- Biologic
  - Blood and body fluid
  - Iatrogenic
    - Blood transfusion
    - Vaccination –needles not vaccine
  - Mother to Child
- Non-Biologic
  - Political
  - Economic
  - Multiple Epidemics

HIV spread

HIV Spread

- **Modes of Transmission**
  - **Political**

Dates of independence of African countries

Consequences of large political upheaval are population movement and potential for malnutrition and immunodeficiency

Zoonotic Transmission of HIV Coincides with Population Expansion in Africa

HIV Spread

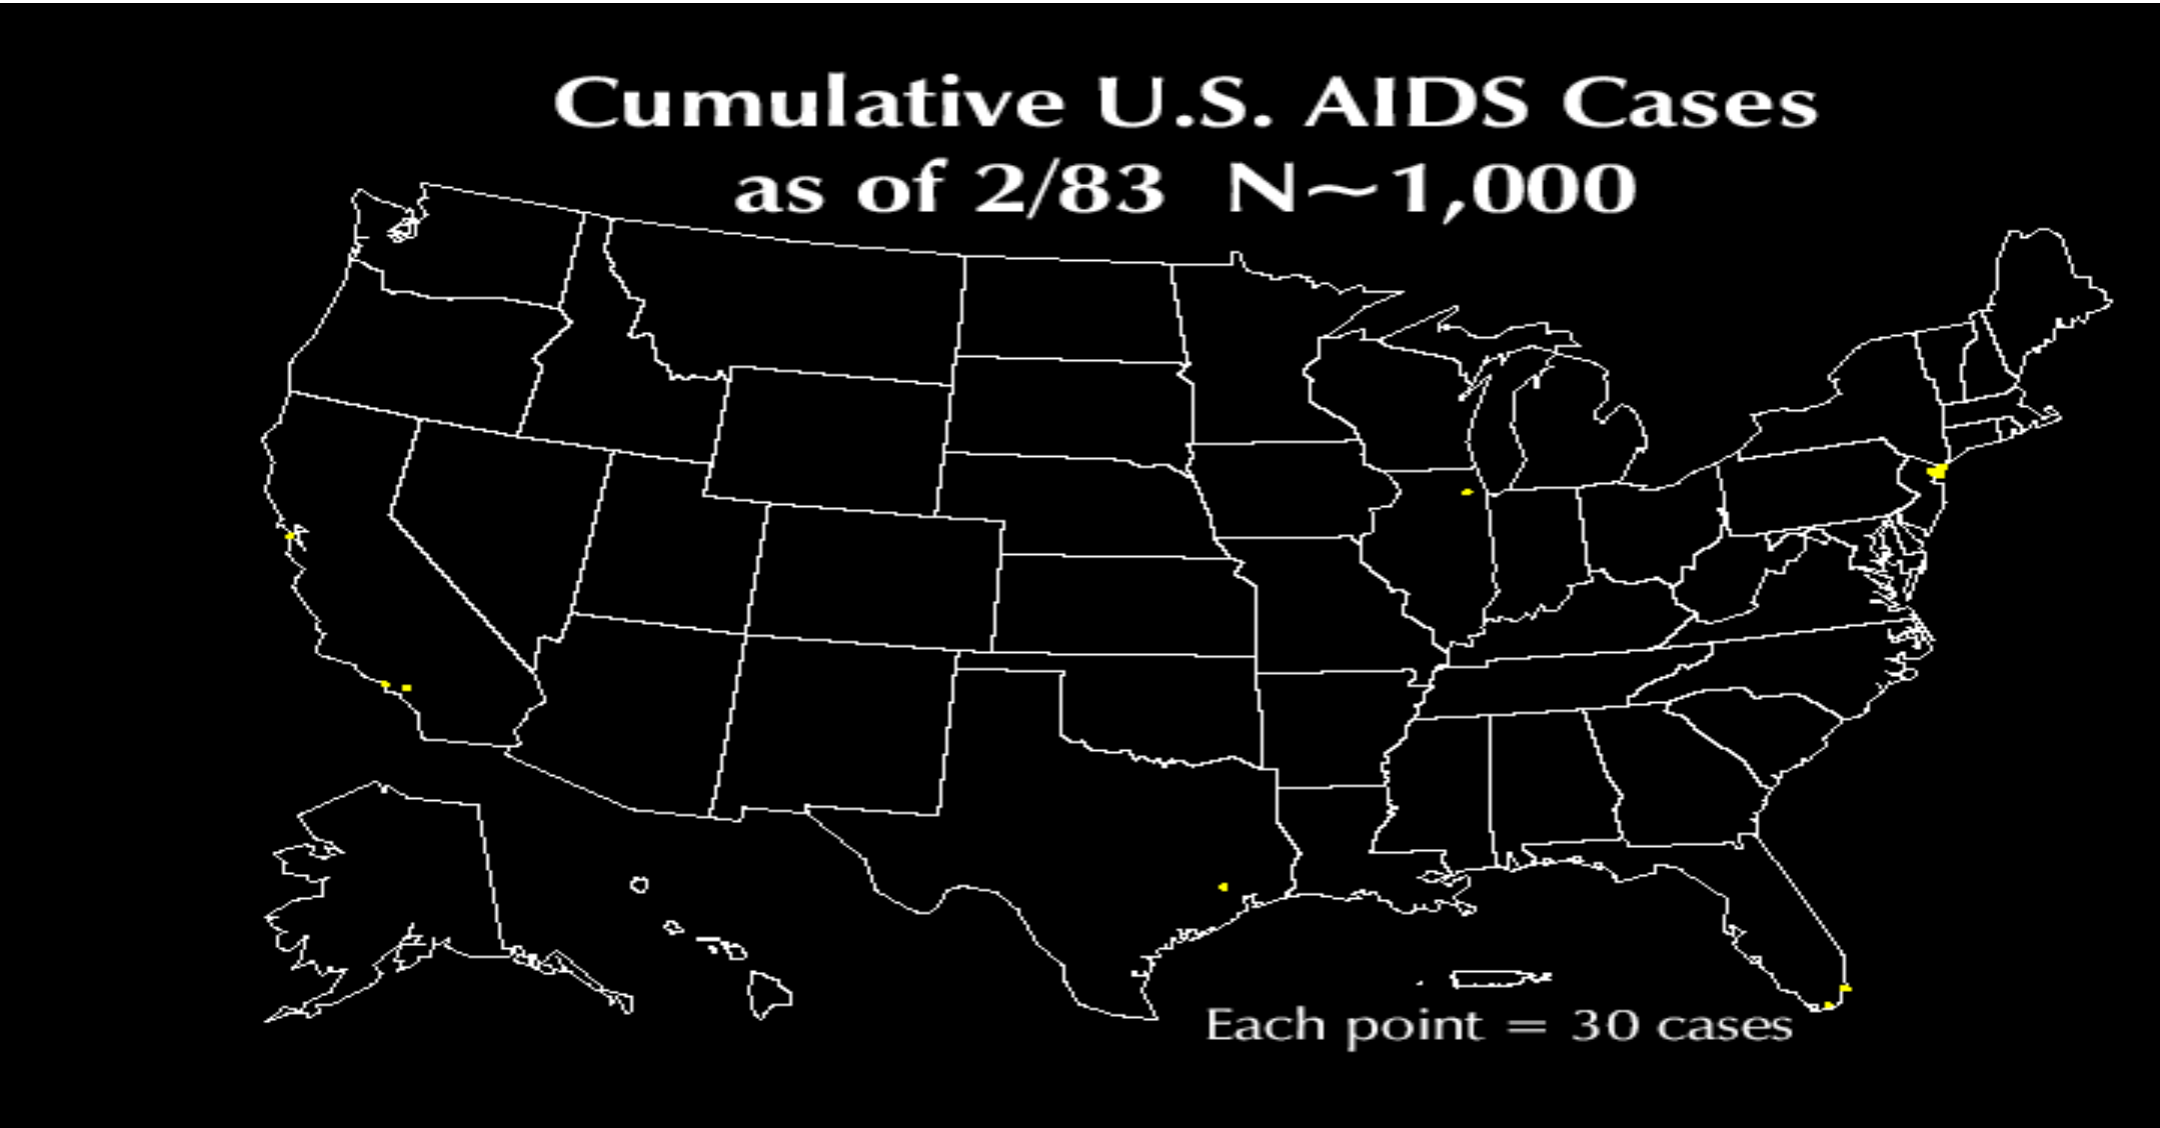
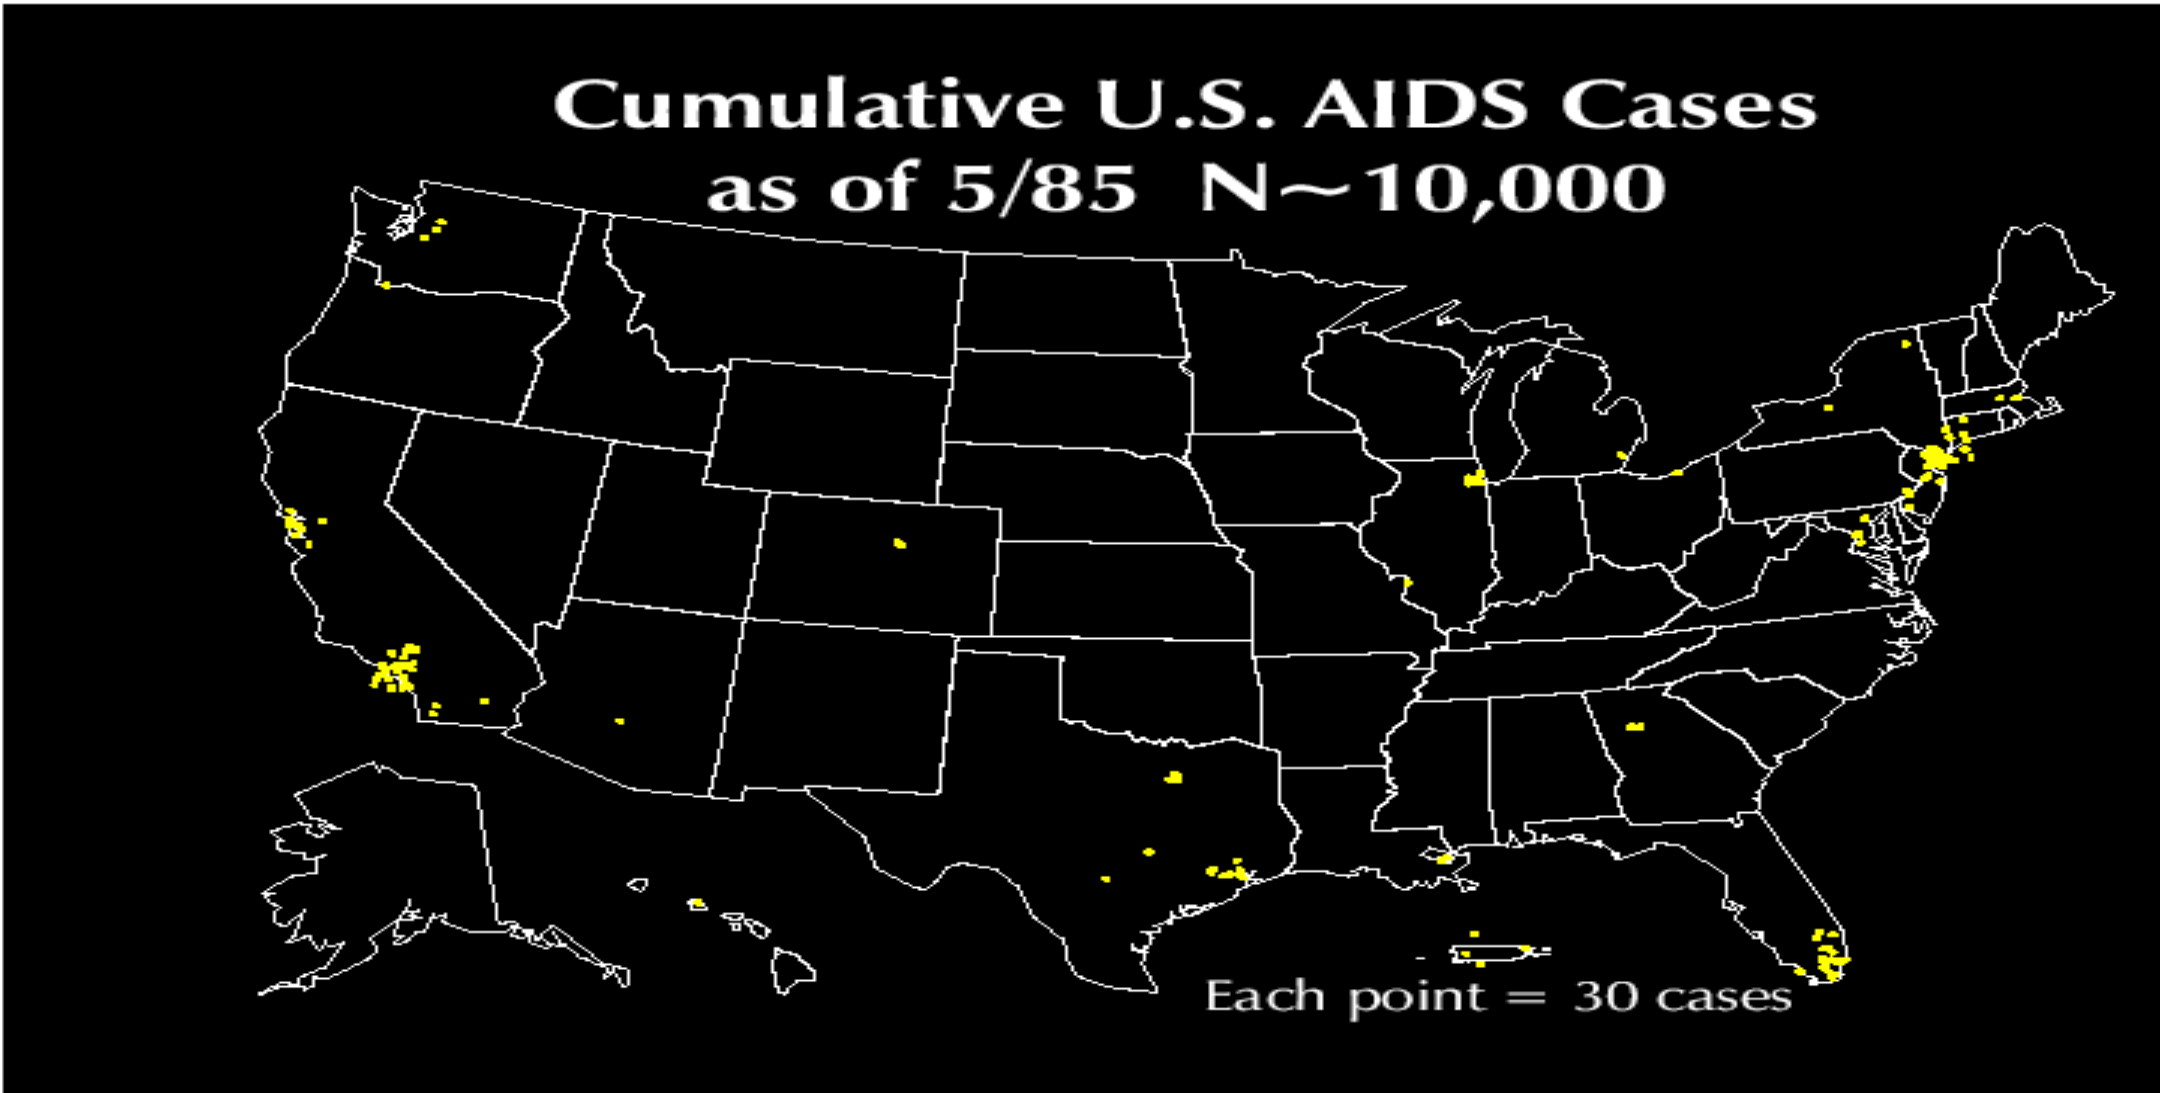
Worobey et al.

AIDS in 1983

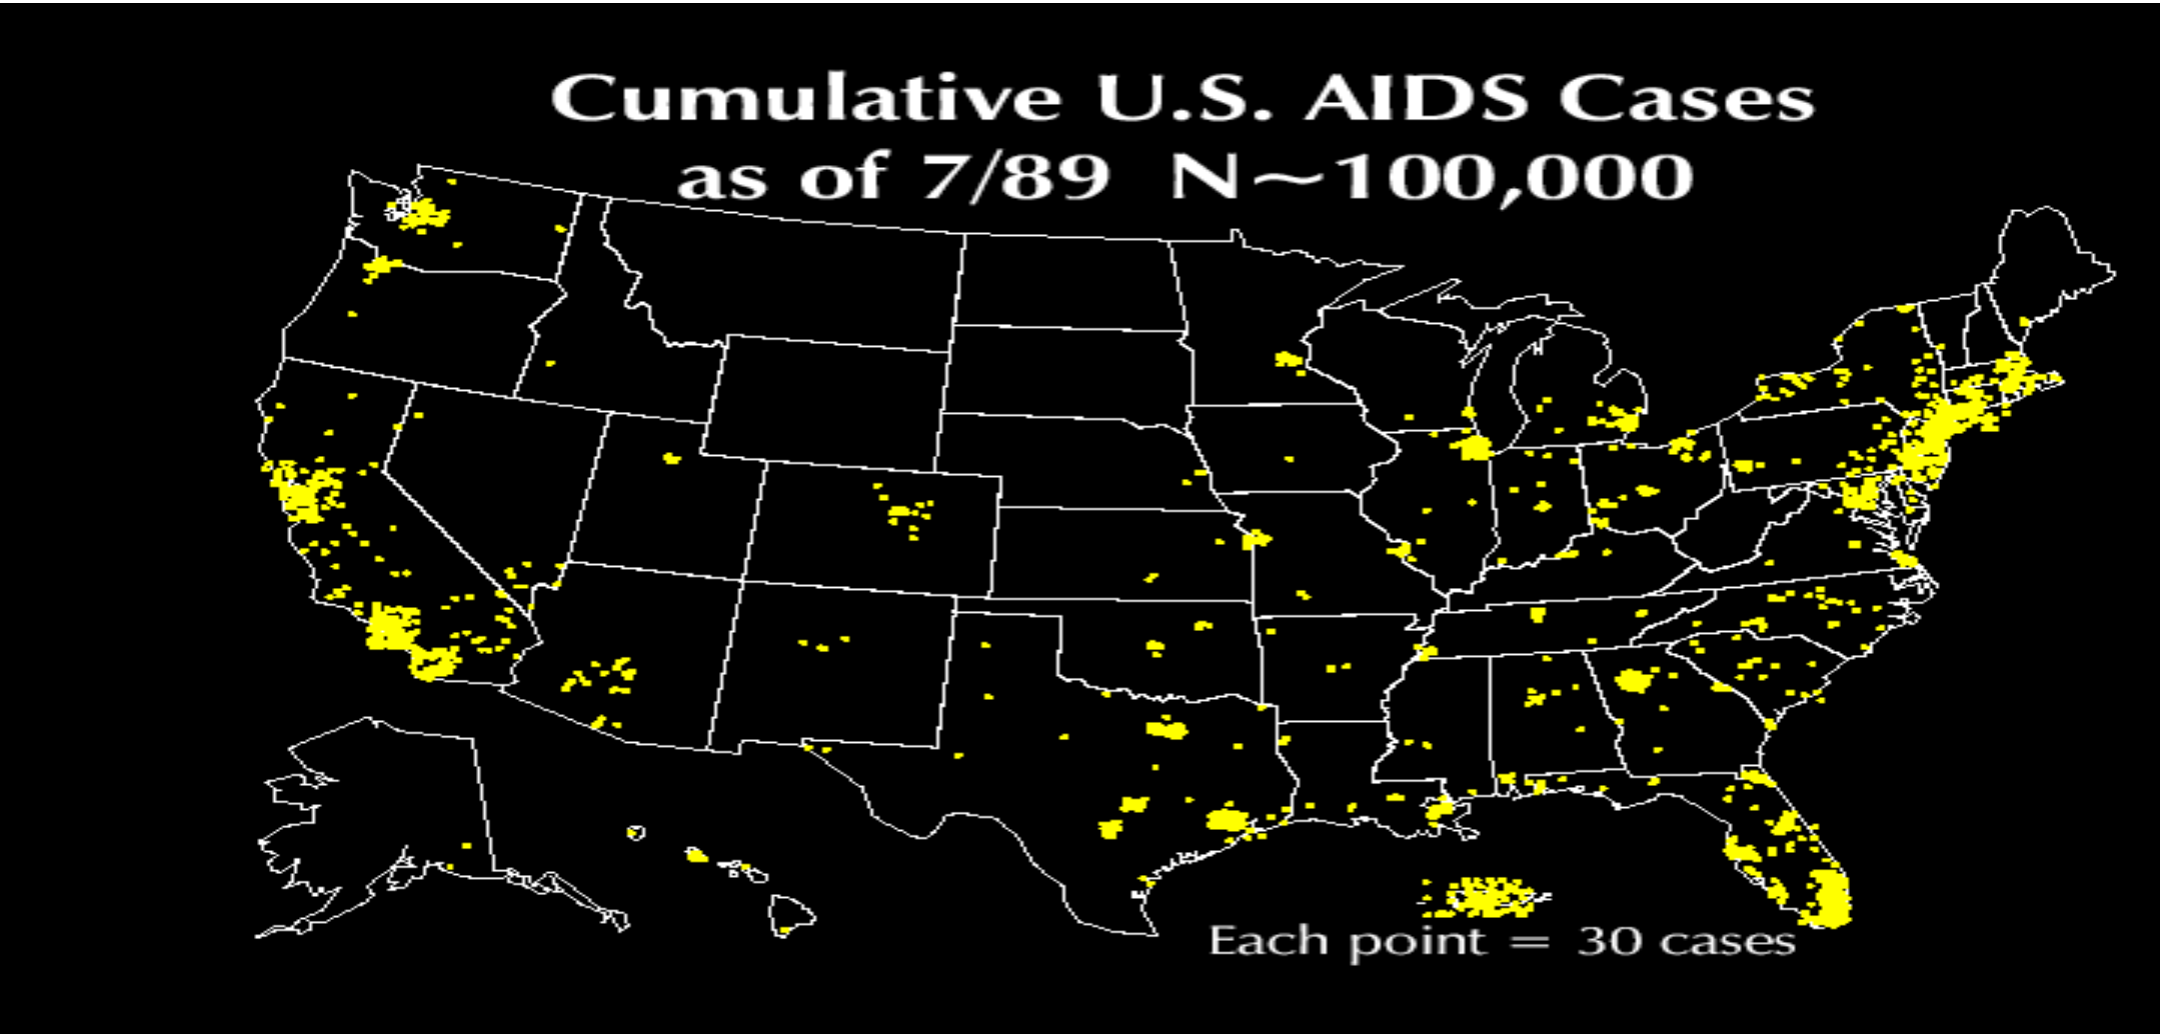


AIDS in 1985



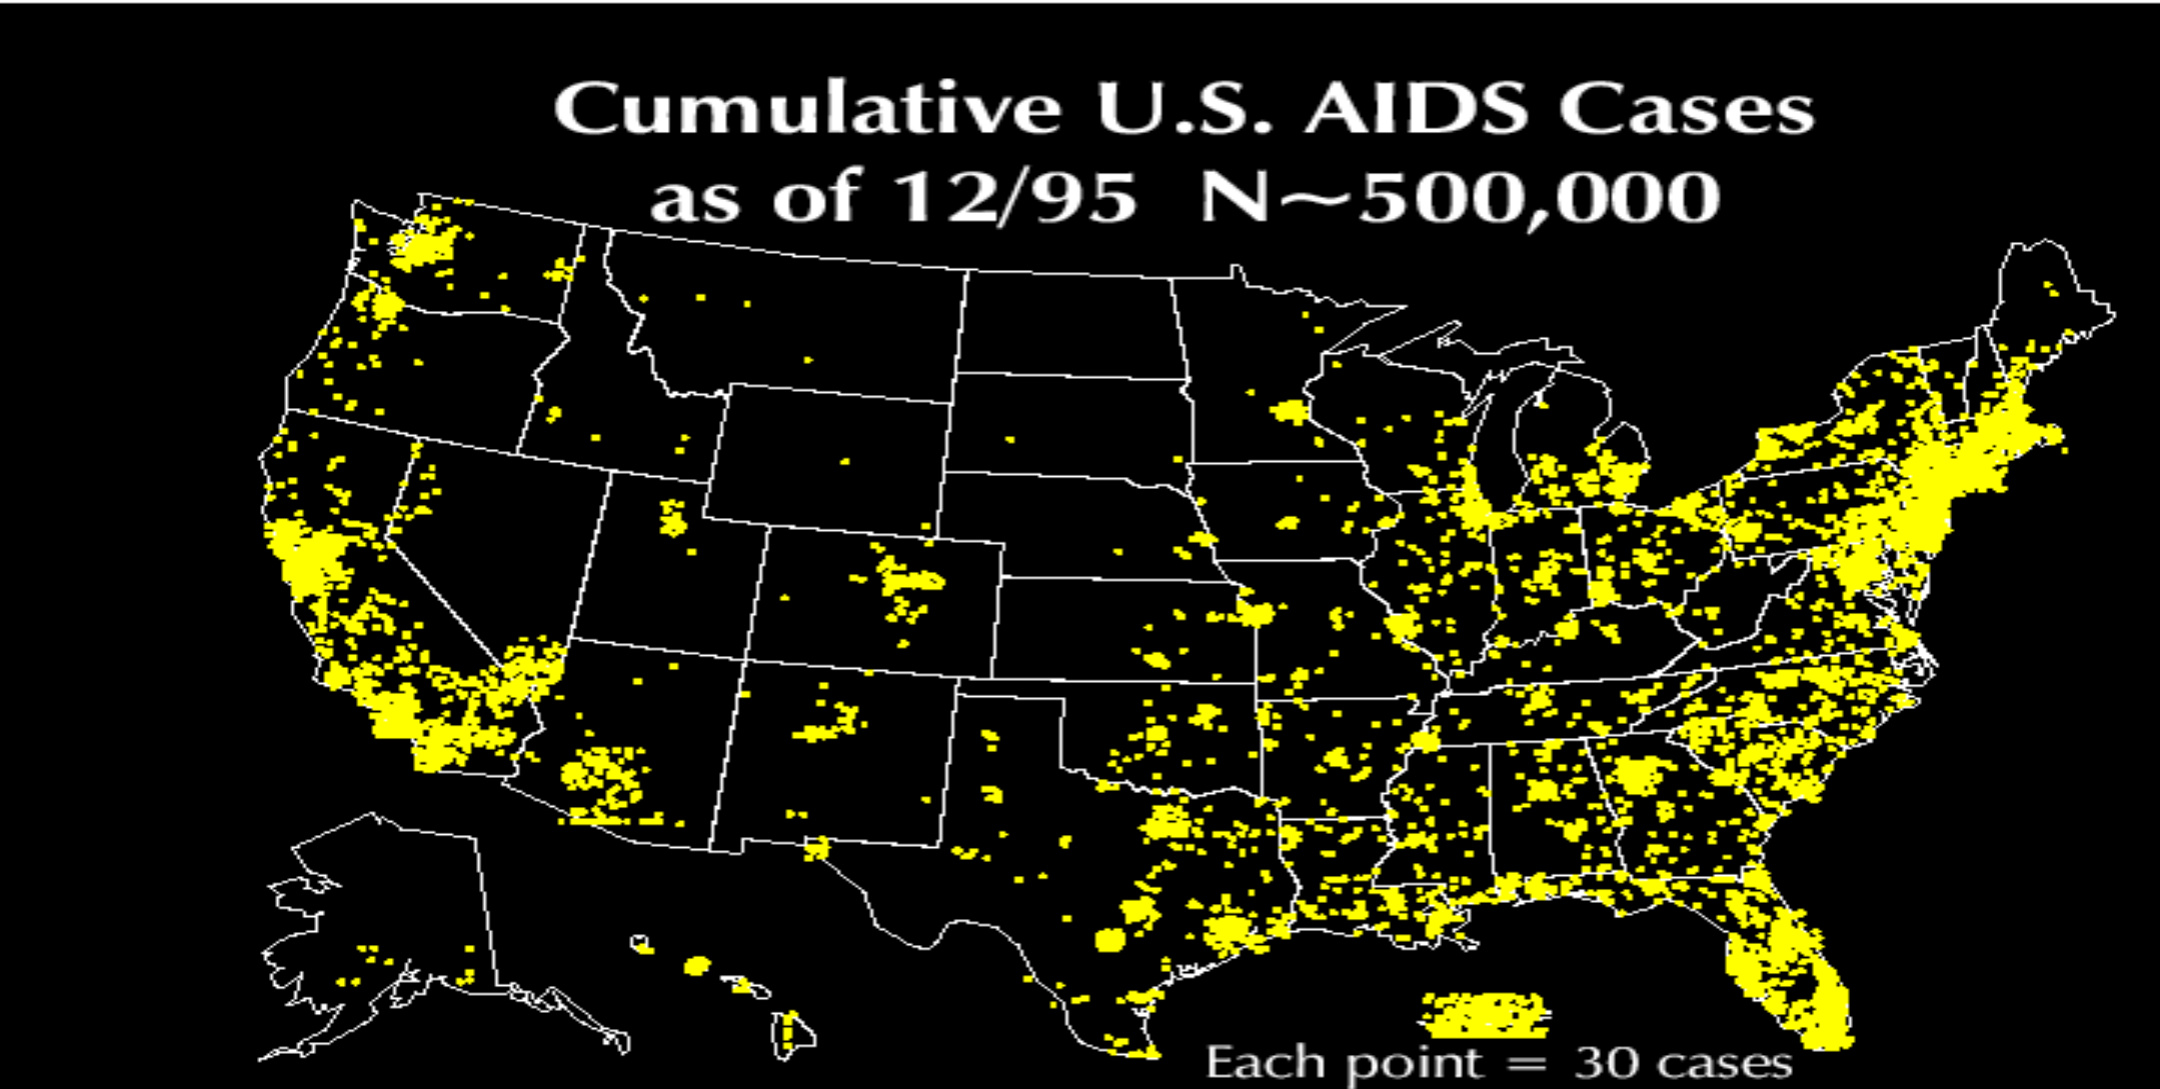
Cumulative U.S. AIDS Cases
as of 5/85 N~10,000
Each point = 30 cases

AIDS in 1989



Cumulative U.S. AIDS Cases
as of 7/89 N~100,000
Each point = 30 cases

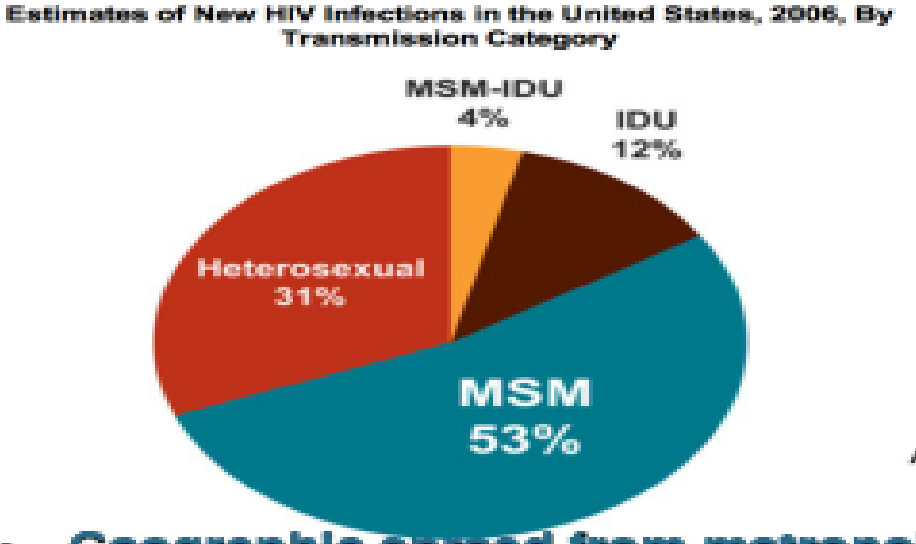
AIDS in 1995

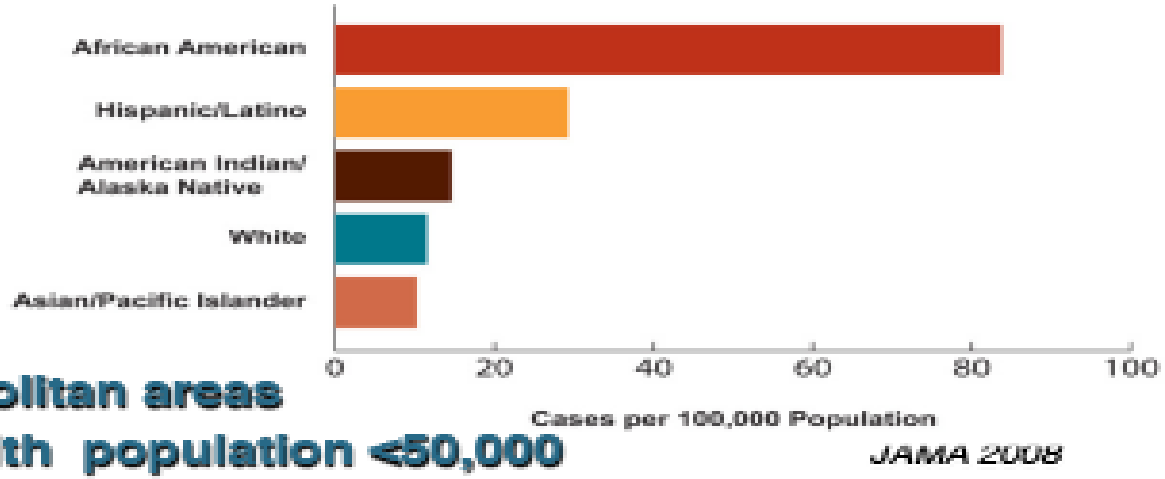


Cumulative U.S. AIDS Cases
as of 12/95 N~500,000
Each point = 30 cases

New cases of HIV/AIDS

New cases of HIV/AIDS—USA



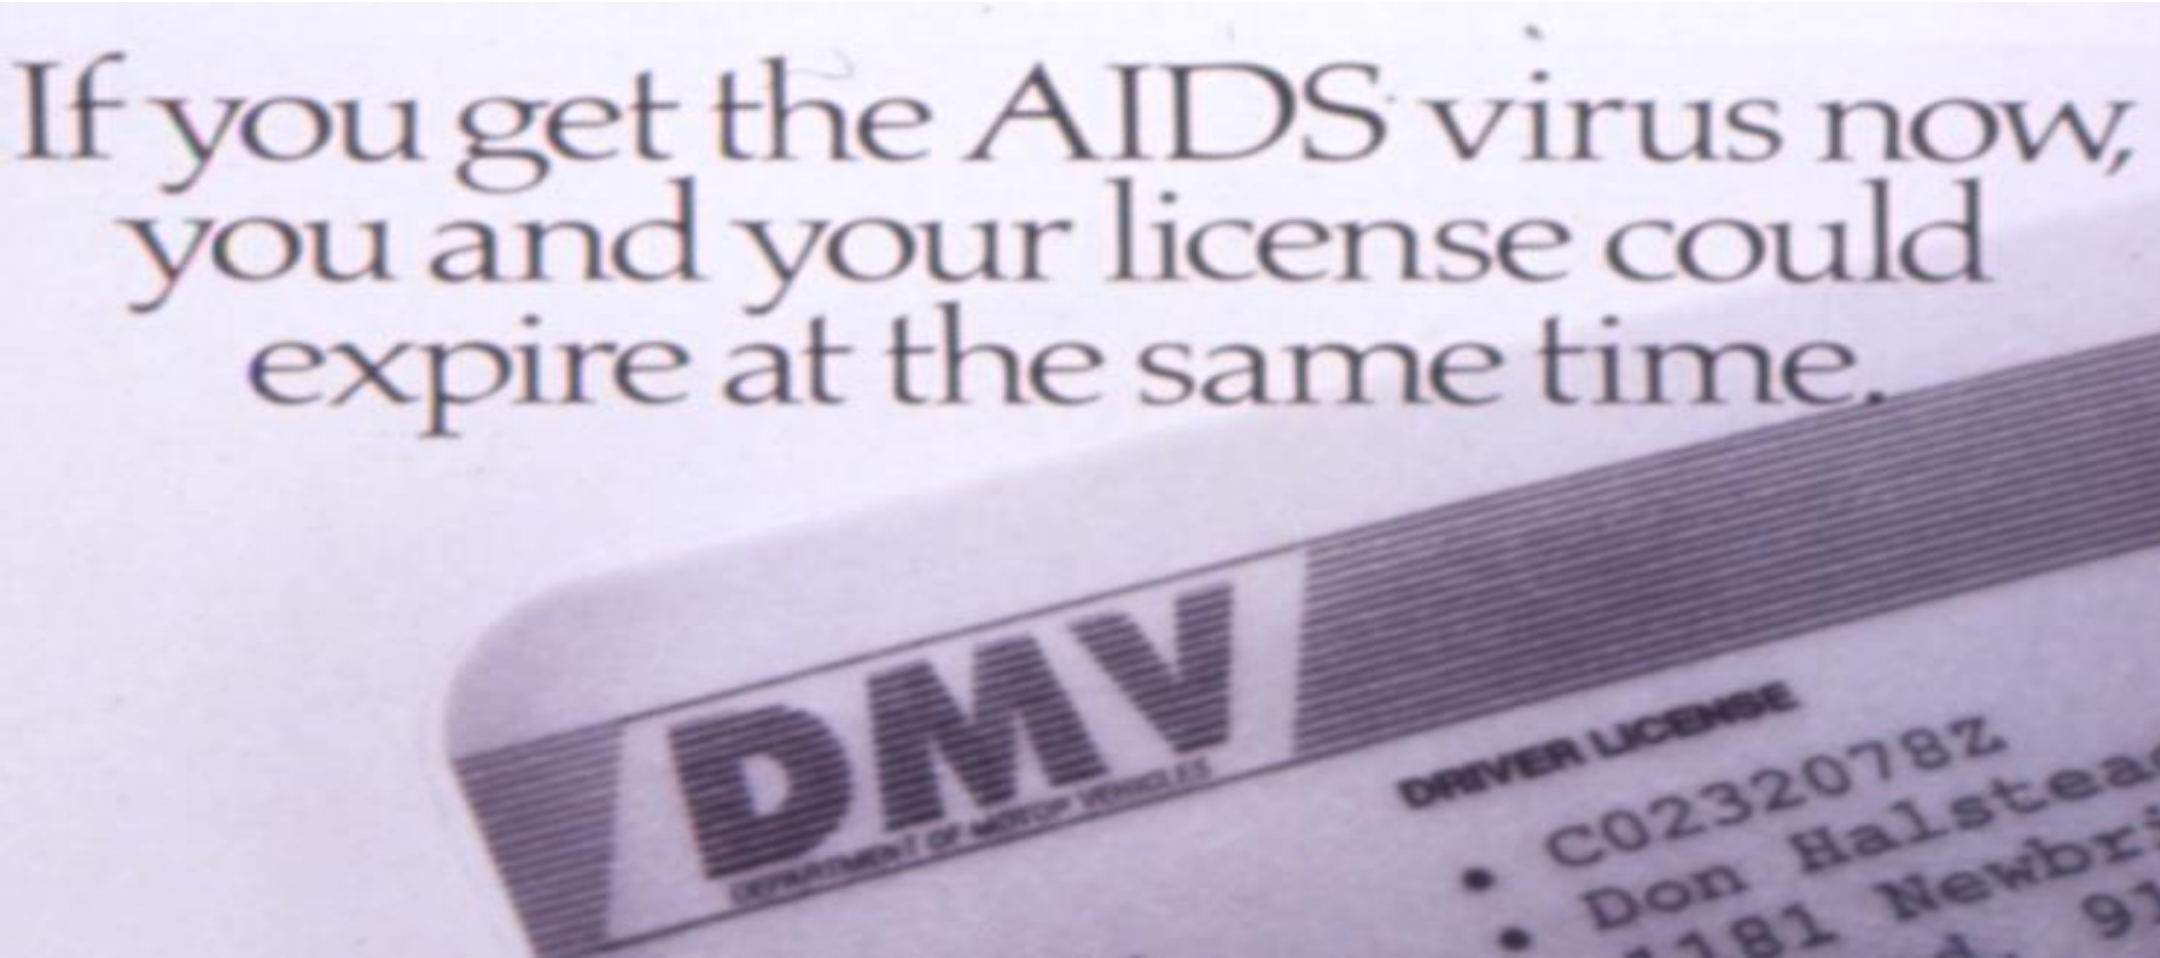


JAMA 2008

- Geographic spread from metropolitan areas
  - ~12% of cases in locations with population <50,000
- Women
  - comprise > 25% of all AIDS cases
- Age
  - 11% of AIDS cases are 50+ years old
  - c.50% of persons living with HIV are >50 yo

HIV Therapy and Beyond

Expiration



If you get the AIDS virus now,
you and your license could
expire at the same time.

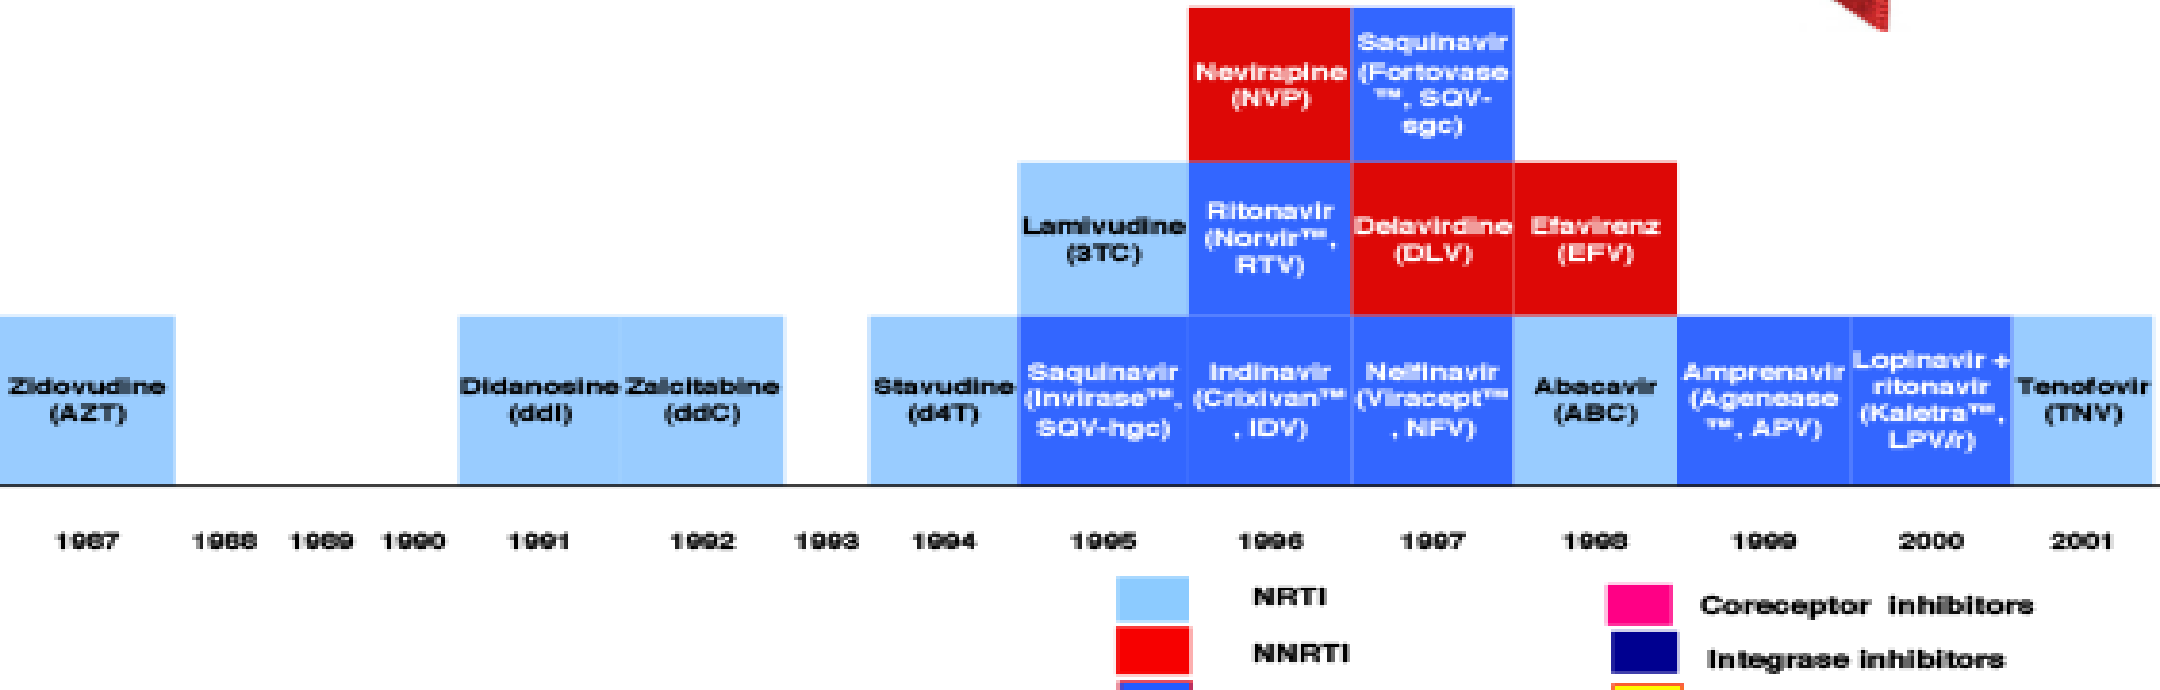
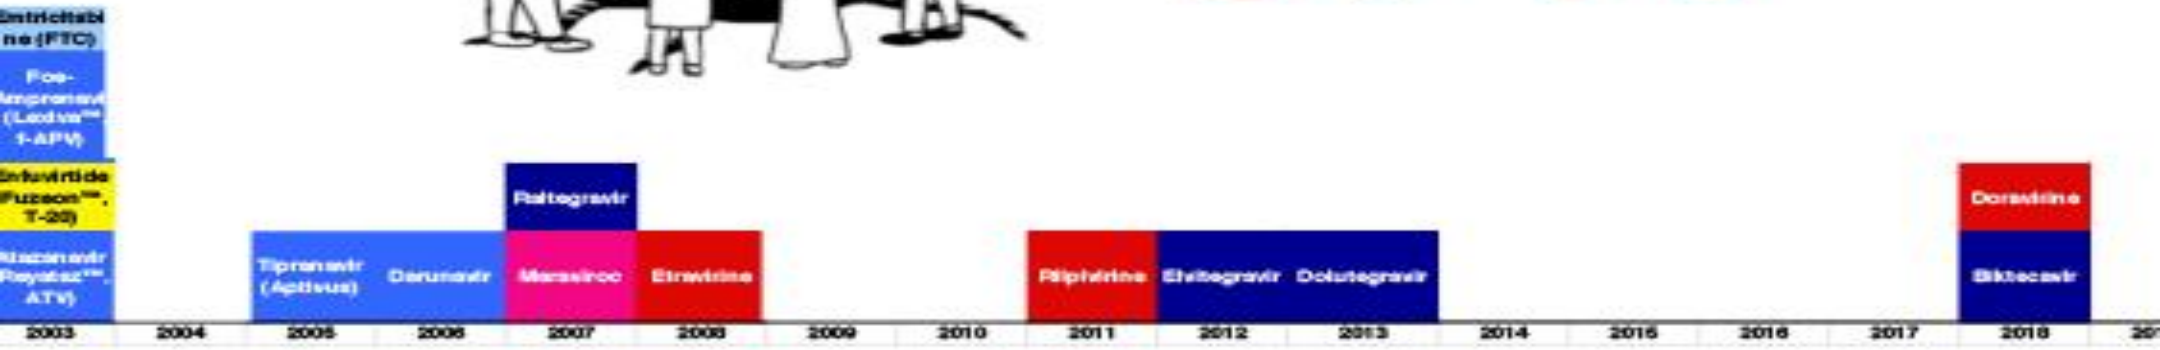
Treatment for all

90-90-90: TREATMENT FOR ALL

GETTING TO ZERO



Worlds AIDS day



The need is great

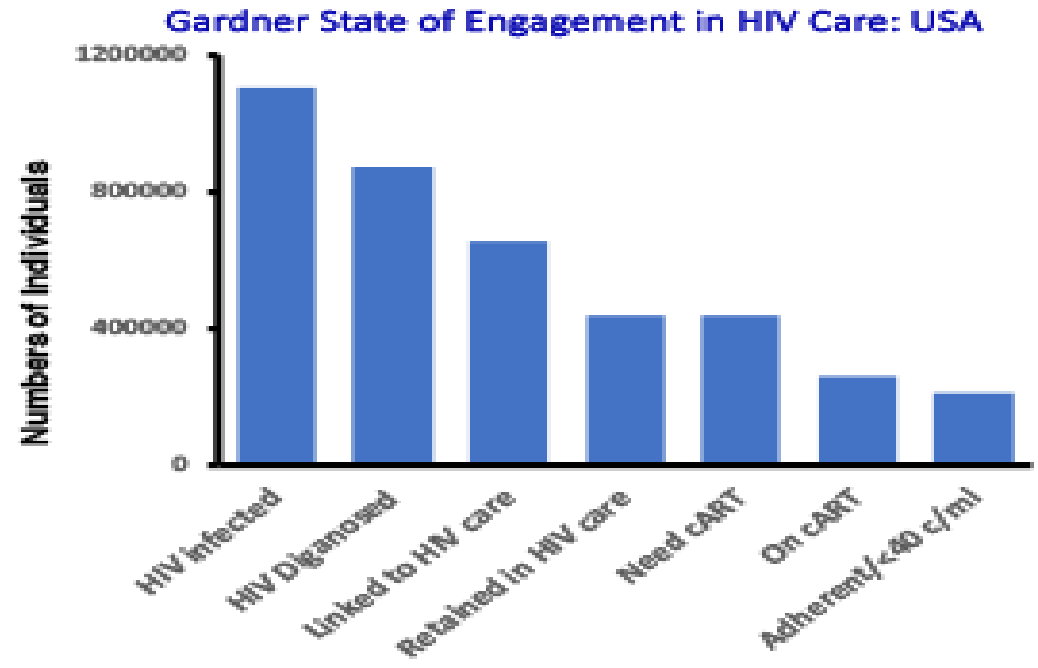
The Need is Great:
HIV is a Challenge on Numerous Levels

HIV Infection - USA

HIV Prevalence is INCREASING

New cases of HIV dlagnosed=38,000

Deaths from HIV = 6465



Key Advances in HIV Therapy

- PrEP
  - Adherent prophylaxis is effective
- SMART Study
  - Continuous therapy essential to avoid AIDS and other complications
- START Study
  - Earlier therapy is initiated, greater preservation of therapy

Next Advances in HIV Therapy

- Vaccines
- Cures

Lessons

- Viruses are bad and should be avoided
- Except when they save the planet
- And maybe if it saves you from the next virus
- Epidemics are not single events
- Epidemics evolve
- Detailed understanding of replication leads to new therapy
- Antivirals are useful
  - Instituted as early as possible
  - Adherence is essential
